## Agradecimentos

Esta dissertação é a reta final de uma longa jornada chamada mestrado. Impossível chegar aqui sozinho: somente com o apoio da família, amigos, professores e instituições é que conseguimos dar este importante passo na vida acadêmica. Só tenho a agradecer:

À CAPES, pela bolsa de estudos que permite aos alunos terem dedicação exclusiva durante o mestrado. À Universidade Federal do Paraná, professores e servidores, pela excelência do ensino e administração do curso, em especial, professor José Felipe Araujo de Almeida, professora Kênia Barreiro de Souza e Laís de Lima Rocha.

A cada um dos professores do PPGDE, pela dedicação incondicional ao ensino, em especial aqueles que tive o privilégio de ser aluno: professores Armando Vaz Sampaio, Marcos Minoru Hasegawa, Maurício Vaz Lobo Bittencourt, Fernando Motta Correia, Victor Rodrigues de Oliveira, Kênia Barreiro de Souza, Terciane Sabadini Carvalho, Vinicius de Almeida Vale. Aos professores que, mesmo longe, não hesitaram em responder os emails de um aluno desconhecido: professores Mario Solis-Garcia e Celso José Costa Junior. Aos professores que não pouparam esforços em manter o aplicativo e o fórum do Dynare: professores Willi Mutschler e Johannes Pfeifer.

Ao meu orientador Armando Vaz Sampaio, pela atenção, entusiasmo e sugestões que fizeram diferença na construção desta dissertação. Aos integrantes da banca de qualificação e de defesa, professores Celso José Costa Junior e Fernando Motta Correia, pelas importantes sugestões para melhoria e continuidade desta pesquisa.

Ao meu chefe Greisson Almeida Pereira, por acreditar neste projeto desde a primeira versão e pelas importantes sugestões que enriqueceram a pesquisa.

Aos meus colegas do mestrado, em especial Felipe Duplat e Matheus Canhete, pela companhia, pelo apoio moral e questionamentos que enriqueceram este trabalho.

Ao meu mentor Flávio von der Osten, por todos os conselhos e cobranças.

À minha heroína Kellen, pela confiança e pelo apoio incondicional.

À minha mãe, pelo exemplo de força e perseverança.

A todos que acompanharam esta jornada e me deram apoio e coragem, meu muito obrigado.

*Been a long journey for you, hasn't it? Lot of running, lot of pain.  
And you, you're a flea on the back of a dragon in for one hell of a ride,  
but you did manage to hang on. I guess that counts for something.*

— He Who Remains

## **Resumo**

O presente projeto de pesquisa propõe criar um modelo DSGE (*Dynamic and Stochastic General Equilibrium* ou Equilíbrio Geral Dinâmico e Estocástico) para investigar os impactos da taxa de juros nominal sobre o produto interno bruto de uma região brasileira.

## **Abstract**

The present research project aims to develop a Dynamic and Stochastic General Equilibrium (DSGE) model to investigate the effects of the nominal interest rate on the Gross Domestic Product (GDP) of a Brazilian region.

# 1 Introduction

## Context

## Problem

## Contributions

## Organization

The importance of macroeconomic modeling as a tool for studying the connections between monetary economy and the outcomes of a country's aggregates is undeniable, as stated by [Galí \(2015\)](#). Considering as well that Brazilian regions possess heterogeneous economic matrices and sectors that respond in different ways to monetary authority decisions, as indicated by [Bertanha and Haddad \(2008\)](#), the need for a structural model capable of relating macroeconomic variables to regional variables becomes evident.

In this context, the present research proposes the development of a macroeconomic model with regional extensions, using the DSGE methodology<sup>1</sup>, which can demonstrate the existing relationships among the various considered variables and present impulse response functions that illustrate these relationships. With this model, we aim to investigate the existing relationship between the nominal interest rate of the Brazilian economy and the level of regional gross domestic product.

## Problem and Justification

The main issue to be investigated is the impact of monetary authority decisions — especially changes in the nominal interest rate — on regional macroeconomic variables, particularly the Gross Domestic Product (GDP) of a given Brazilian region (such as a state, for example).

Given that Brazilian regions have distinct economic matrices (agriculture, industry, extraction, etc.), and within each of these specializations, some sectors are more

---

<sup>1</sup> Dynamic and Stochastic General Equilibrium.

labor-intensive while others are capital-intensive, it is plausible to assume that regional diversity allows each region to react differently to changes in the interest rate.

Given the problem, we need to determine how the study will be conducted. As this is a topic that combines knowledge from Macroeconomics and Regional Economics, it will be necessary to address the main concepts from both areas to then determine a methodology capable of integrating all of this content.

Regional Economics investigations often employ tools borrowed from Macroeconomics, as highlighted by [Rickman \(2010\)](#). Examples include the Leontief input-output model, the Walrasian general equilibrium applied model, and the system of macroeconometric equations. These instances demonstrate how models from one field can be adapted and utilized by the other.

In line with this notion, the objective of this work is to utilize a DSGE model (derived from Macroeconomics) to establish relationships between macro variables and regional variables. Subsequently, Brazilian economic data will be employed to ascertain the degree of correlation between these variables.

Numerous studies address the effects of national aggregates on regional variables, and these will be appropriately presented in section [2](#). However, in these studies, we have not found one that specifically investigates the relationship between the national nominal interest rate and regional GDP.

The significance of this work can be identified by recognizing that, given the diversity of Brazilian regions, it is not plausible that a single macroeconomic variable will have the same effect in each of them (or at least not with the same intensity). Thus, a tool capable of quantifying the regional effect of a macroeconomic variable is an important addition to economic literature, as it investigates the transmission mechanisms of monetary policy to the regional aggregate. Additionally, it also adds to the array of policy evaluation instruments, such that various economic agents can use this tool to determine the conduct of their own internal policies. For example, banks can quantify the credit interest rate for a specific region based on the projected interest rate, considering the needs and potential development of each region separately from the rest of the country.

## Objectives

The main objective is to create a DSGE model capable of relating a macroeconomic variable (the nominal interest rate) to a regional variable (the Gross Domestic

Product of a Brazilian region), in order to assess the impact of an expansionary (or contractionary) monetary policy on a specific Brazilian region and the magnitude of that impact.

The specific objectives are (1) elaborate a New Keynesian DSGE model with households, firms, monetary authority, price stickiness, productivity and monetary shocks to verify if the nominal interest rate determined by the monetary authority influences the national GDP; (2) determine which variables must be regionalized in order to make a regional environment in order to verify if two regions may have different responses to the monetary policy shocks; (3) produce IRF and analyse the results of the regional model.

## 2 Literature Review

**Define the Scope:** Begin by defining the scope of your literature review. Clearly state the research questions or objectives you aim to address and the specific areas of macroeconomic modeling you'll cover.: **ok**

This section provides a literature review, exploring the intersection between Regional Economics and Macroeconomics, emphasizing the importance of monetary policy, and delving into the applicability of DSGE models to address diverse economic challenges, including regional and monetary dilemmas. The discussion also underscores the need for a clear definition and methodological framework in utilizing DSGE models.

**Search for Relevant Literature:** Conduct a comprehensive search of academic databases, journals, books, and other reputable sources. Use relevant keywords and filters to find literature related to your research topic.: **ok**

**Organize the Material:** Categorize the literature into themes, topics, or key concepts. This organization will help you structure your review logically.: **ok**

**Summarize Key Concepts:** For each theme or concept, provide a concise summary of the theories, models, and empirical findings. Explain the main ideas and the contributions of each study.: **ok**

**Identify Gaps and Controversies:** As you review the literature, pay attention to gaps in the research. Are there areas where the literature is lacking or conflicting? Highlight these gaps and controversies.: **ok**

**Include Empirical Studies:** Discuss empirical studies related to your research topic. Summarize the methods, data sources, and key findings of these studies. Explain how empirical research has contributed to the field.: **ok**

**Relate to Your Research:** Throughout the literature review, connect the reviewed material to your own research. Explain how the existing literature informs your research questions and hypotheses.: **ok**

### Macroeconomics and Regional Economics

The assessment by [Rickman \(2010\)](#) on the importance of the link between Macroeconomics and Regional Economics was made at a time when the use of structural mod-

els to investigate regional issues was not yet common. Since then, several studies have addressed this connection.

Initially, we present two works that served as inspiration for the present research. The first, developed by [Costa Junior et al. \(2022\)](#), investigates the impacts of fiscal policy on the state of Goiás, considering the other states of the nation. In this work, the authors develop a regionalized and open structure, individualizing a Brazilian state from the rest, considering both a national and a state fiscal authority; state expenses and revenues are disaggregated, and thus, the authors seek to identify whether there are differences between the impacts of a tax exemption in the state under study compared to the others. With the model calibrated to data from 2003 to 2019, the authors demonstrate that there is indeed a difference in state performance due to the distinction of the tax exemption occurring in the state or in the rest of the country.

The second work also presents a DSGE model, but with the objective of evaluating whether there are differences in the effects of Foreign Direct Investment (FDI), considering its location. The model developed by [Mora and Costa Junior \(2019\)](#) encompasses an open economy with the main region (Bogotá, 25% of the national GDP) and the rest of the country (Colombia), two types of households<sup>2</sup>, habit formation, capital adjustment costs, as well as typical elements of a New Keynesian (NK) model<sup>3</sup>. With the model calibrated to data from 2002 to 2015, the authors demonstrate that there is indeed a difference in the effects of FDI depending on the region where it is applied, such that when applied in the rest of the country, there are growth effects that spread throughout the country through spillovers, including to the main region.

Both works aim to, despite dealing with distinct causes (fiscal policy and FDI), verify whether differences exist when the cause occurs in one of the two different modeled regions. Additionally, they share the same modeling approach, that of a Dynamic and Stochastic General Equilibrium (DSGE). And this was the advancement that [Rickman \(2010\)](#) wanted to see happen: the use of macroeconomic models to address regional questions.

---

<sup>2</sup> Ricardian and non-Ricardian agents.

<sup>3</sup> nominal price rigidity, monopolistic competition, non-neutrality of monetary policy in the short term.

## Monetary Policy

DSGE models are widely employed within the macroeconomic literature to examine the effects of monetary policy on macroeconomic aggregates, as pointed by [Galí \(2015\)](#). In this context, it is important to add to the review the papers that develop models describing the monetary policy.

[Smets and Wouters \(2003\)](#) and [Smets and Wouters \(2007\)](#) present models that evaluate various types of shocks in the Eurozone and the United States, respectively. [Walque et al. \(2010\)](#) assess the role of the banking sector in market liquidity recovery, considering the endogenous possibilities of agent default.

[Vinhado and Divino \(2016\)](#) employ a model with financial frictions to examine the transmission of monetary policy to the banking sector and economic activity. The results demonstrate that the banking sector plays a significant role in economic activity and impacts the outcomes of monetary policy by having to adjust the bank spread in response to changes in the interest rate or reserve requirements.

[Soltani et al. \(2021\)](#) investigate financial and monetary shocks on macroeconomic variables, with special attention to the role of banks. For this analysis, the model considers an economy with a banking sector. The results indicate that banking activity can influence the effects of economic policies.

[Holm et al. \(2021\)](#) study the transmission of monetary policy to household consumption, estimating the response of consumption, income, and savings. They utilize a heterogeneous agent New Keynesian model (HANK). The results demonstrate that a restrictive monetary policy prompts households with lower liquidity to reduce consumption as disposable income starts to decline, while households with average liquidity save less or borrow more. The study also highlights the differences in consumption changes between savers and borrowers in the face of a monetary policy alteration.

[Capeletti et al. \(2022\)](#) evaluate the effects of pro-cyclical and counter-cyclical credit expansions by public banks on economic growth. The model implements a banking sector with public and private banks competing in a Cournot oligopoly. The results show that the supply of public credit has a stronger effect when the policy is counter-cyclical.

## Macroeconomic Modeling

The scientific literature on DSGE modeling is extensive, as it allows for the formulation of various questions and their answers through a general equilibrium model. This includes the aforementioned topics and, also, labor market, as explored by [Ribeiro \(2023\)](#); the real estate market, as studied by [Albuquerque \(2018\)](#); and even deforestation, as investigated by [Pereira and Góes \(2013\)](#). As remarked by [Solis-Garcia \(2022\)](#): *if you have a cohesive economic idea, you can put it in terms of a DSGE model.*

The works of [Costa Junior \(2016\)](#), [Solis-Garcia \(2022\)](#), [Bergholt \(2012\)](#), and [Galí \(2015\)](#), between others, are essential materials for macroeconomic modeling theory, as they guide the reader in developing a DSGE model step-by-step. [Costa Junior \(2016\)](#) starts from a Real Business Cycles (RBC) model and chapter by chapter adds elements of New Keynesian (NK) theory to the model. [Solis-Garcia \(2022\)](#) focuses on the mathematical details necessary to develop a DSGE model, beginning with a RBC model and turning it into a canonical NK model. [Bergholt \(2012\)](#) discusses the key elements of a New Keynesian model and also demonstrates the necessary programming to run the model using the Dynare software. [Galí \(2015\)](#) shows the evolution from an RBC model to an NK model, adding complexity with each chapter.

## Macroeconomic Modeling with Regions

Among the works employing DSGE modeling with regions, beside the already mentioned before, there is the study by [Tamegawa \(2012\)](#), which assesses the effects of fiscal policy on two regions using a model featuring two types of households, firms, banks, a national government, and a regional government. Using literature parameters to calibrate the model, the results indicate that indeed there are differences in the effects of fiscal policy depending on which region implements it. It is important to note that the difference between a macroeconomic model and a regional one lies in the fact that in the former, aggregate variables are considered only at the national level, whereas in the latter, both national and regional variables are considered, and depending on the size of the region, the latter might not be able to affect the former, as explained by [Tamegawa \(2013\)](#). A framework to assess the economic evolution of a region in Japan is constructed by [Okano et al. \(2015\)](#), with the aim of identifying the causes of stagnation in the Kansai region.

In a similar vein of demonstrating regional relationships, [Pytlarczyk \(2005\)](#) investigates aspects of the European Monetary Union (EMU), focusing on the German

economy, using a structural model with two regions; [Galí and Monacelli \(2005\)](#) also evaluates the functioning of the EMU, but with a model where regions form a unitary continuum, such that one region cannot affect the entire economy. [Alpanda and Aysun \(2014\)](#) utilize a two-region model to assess the effects of US financial shocks on the euro area economy.

More recently, the article by [Croitorov et al. \(2020\)](#) seeks to identify spillovers between regions, building a model with three regions: the Euro area, the US, and the rest of the world. Similarly investigating spillovers, [Corbo and Strid \(2020\)](#) present a regional model encompassing Sweden and the rest of the world.<sup>4</sup>"

## DSGE Methodology

**Discuss Theoretical Foundations:** Describe the fundamental macroeconomic models, theories, and frameworks relevant to your research. Explain how these theories have evolved over time and influenced the field.

**Emphasize Methodology:** If your research involves specific methodologies or econometric techniques, discuss them in this section. Explain the relevance of these methods within the context of macroeconomic modeling.

The DSGE methodology, as the name implies, involves the utilization of a Dynamic and Stochastic General Equilibrium model. This model outlines the problem to be addressed, requiring the definition of agents, variables, and parameters. In this research, the objective is to assess the impact of monetary policy on regional gross domestic product using the Canonical New Keynesian structure, as proposed by [Solis-Garcia \(2022\)](#). The structure comprises four representative agents: a household, a retail firm, a continuum of wholesale firms, and a monetary authority. It incorporates key elements of the New Keynesian theory, including monopolistic competition among wholesale firms, the price stickiness they encounter, and the consequential role of monetary policy in the short run. The role of each agent, variable and parameter will be discussed in detail in the next section.

---

**Cite Properly:** Ensure that you cite all the sources accurately and consistently

---

<sup>4</sup> Spillovers: effects that are transmitted from one region to another due to an exogenous factor, such as being neighboring regions.

according to the required citation style (e.g., APA, MLA, Chicago).

**Use Subheadings:** Use subheadings to clearly delineate different themes or topics within the literature review. This makes it easier for your readers to follow your discussion.

**Provide Critical Analysis:** Don't just summarize the literature; critically evaluate the strengths and weaknesses of the studies you've reviewed. Discuss any methodological limitations or potential biases in the research.

**Keep it Relevant:** Stick to the literature that is directly relevant to your research questions. Avoid going off-topic or including excessive detail.

**Conclude the Literature Review:** Summarize the key takeaways from your review. Restate the gaps in the literature and how your research will address them.

**Be Concise and Clear:** Write in a clear, concise, and organized manner. Avoid overly technical jargon that might confuse readers.

**Revise and Proofread:** Review and edit your literature review section for clarity, coherence, and grammatical accuracy.

**Seek Feedback:** Share your literature review with your thesis advisor or a peer for feedback and suggestions for improvement.

**Update as Necessary:** If you make significant changes to your research, revisit and update your literature review to reflect any new developments in the field.

### 3.1 Regional New Keynesian Model

The model is populated by four agents: (1) a representative household, (2) a continuum of firms producing intermediate goods, (3) a firm producing a final good, and (4) the monetary authority.

The representative household maximizes utility based on consumption and labor, subject to a budget constraint composed of wages, capital rental rates, and firm profits.

The final-goods firm produces the final-good consumed by households: it aggregates all intermediate-goods produced by intermediate firms, operates under perfect competition and seeks to maximize profit subject to the bundle technology.

Each intermediate-goods firm produces a single intermediate-good, all exhibiting imperfect substitution, thus operating in monopolistic competition. Intermediate-goods firms have two problems to solve: minimize costs subject to production level and choose an optimal price to maximize the intertemporal profit flow.

Periodically, a portion of intermediate-goods firms have the opportunity to adjust prices, while others miss this chance, following a [Calvo \(1983\)](#) rule. This mechanism generates nominal price rigidities, altering equilibrium relationships in the system. These rigidities lead to the non-neutrality of money in the short term, as explained by [Costa Junior \(2016, p.191\)](#).

The monetary authority determines the nominal interest rate in response to fluctuations in previous period's inflation and production, aiming to control price levels and growth, following a [Taylor \(1993\)](#) rule.

Stochastic shocks will be present in the intermediate-goods firms' productivity and in the monetary policy.

These elements define a canonical NK DSGE model, as presented by ([SOLIS-GARCIA, 2022](#)). The model will be adapted to accommodate two distinct regions: the main region and the rest of the country, replacing the single aggregated region. To achieve this, an index will differentiate the studied region from the rest of the country, resulting in separate households, intermediate- and final-goods firms for each region. Households lack mobility between regions. The link connecting the two regions is established through the final-goods, allowing households to consume from both regions.

Then, equilibrium conditions of the system will be determined. Assuming the system tends toward long-term equilibrium, a steady state will be reached where variables cease to change. Thus, for a given  $t \rightarrow \infty$ , we will have  $X_t = X_{t+1} = X_{ss} \implies$

$\dot{\mathbf{X}} = 0$ , where  $\mathbf{X}$  denotes the vector of system variables,  $ss$  indicates the steady state and  $\dot{\mathbf{X}} = \partial\mathbf{X}/\partial t$ .

After that, the log-linearization method proposed by Uhlig (1999) will be employed to convert the system of equations into a linear system, so that this linear system can be solved by the program Dynare, which computes the solution and produces impulse-response graphs based on the stochastic shocks.

## Regions

falta revisar esta parte e agrupar por agentes da economia.

colocar estatística descritiva para justificar as variáveis.

Regions will have an index  $\eta \in \{1, 2, \dots, n\}$  representing the variables of each region. Whenever necessary, a second region index  $\nu \in \{1, 2, \dots, n\}$  will be used. For example, the variable  $C_t$  represents the total consumption (the grand total of all regions),  $C_{\eta t}$  represents the consumption composition of region  $\eta$  and  $C_{\eta\nu t}$  represents the consumption of final-good of region  $\nu$  by region  $\eta$  (the first index indicating the origin and the second the destiny of the good). Without loss of generality, the model will have two regions: the main region 1 and the remaining of the country 2, so that  $\eta, \nu \in \{1, 2\}$ .

## Model Diagram

Figure (1) illustrates the model's mechanics. In this diagram, black arrows depict the real economy, while green arrows represent the nominal economy. The representative household supplies labor and capital to intermediate-goods firms in exchange for wages and capital rent, respectively. Using these resources, intermediate-goods firms produce goods, which are then sold to the final-goods firm. The final-goods firm aggregates all intermediate goods into a final product, sold back to the household. Operating under a monetary rule, the monetary authority determines the nominal interest rate to achieve output growth and price stability.

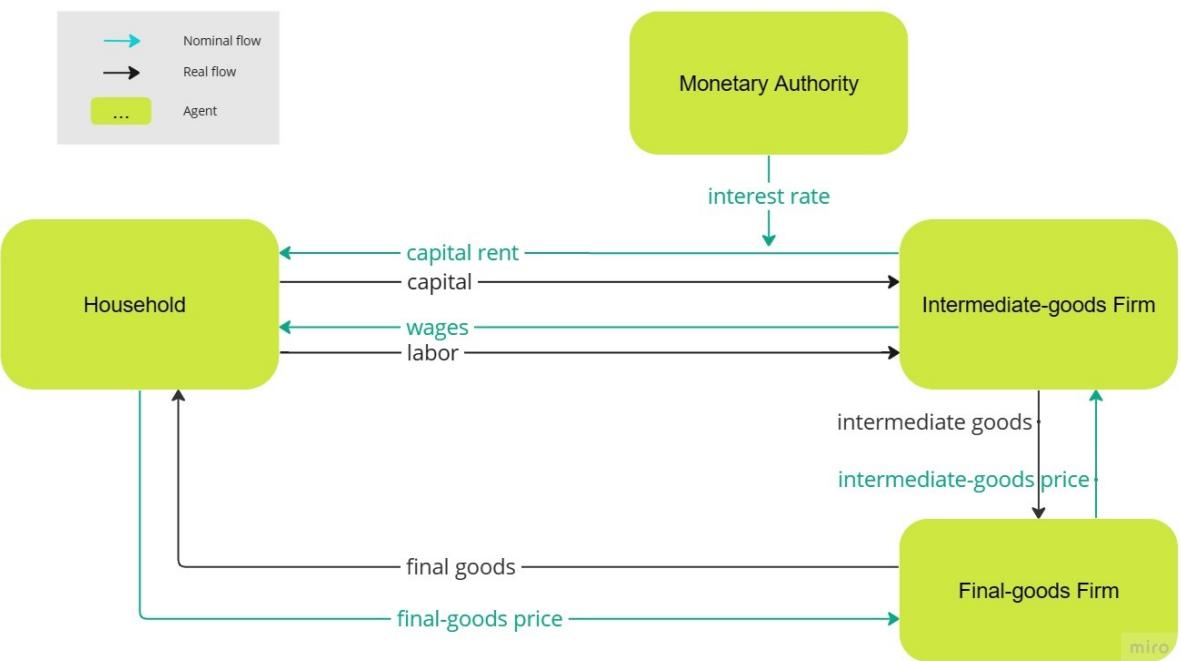

Figure 1: Model Diagram, created by the author.

In the next section, the mathematical structure of the model is presented.

### 3.1.1 Household

The household problem can be divided into two components: first, minimizing consumption costs, and then maximizing utility subject to a budget constraint.

#### Cost Minimization Problem

Considering that the representative household must decide to consume goods from both regions, there must be a consumption bundle index  $C_{\eta t}$  and a consumption price index  $Q_{\eta t}$  the minimizes the total consumption cost  $Q_{\eta t}C_{\eta t}$ , as demonstrated by [Walsh \(2017, p.424\)](#):

$$\min_{C_{\eta 1t}, C_{\eta 2t}} : Q_{\eta t}C_{\eta t} = P_{1t}C_{\eta 1t} + P_{2t}C_{\eta 2t} \quad (3.1)$$

$$\text{s. t.} : C_{\eta t} = C_{\eta 1t}^{\omega_{\eta 1}} C_{\eta 2t}^{1-\omega_{\eta 1}} \quad (3.2)$$

$$C_{\eta t} > 0$$

where  $P_{1t}$  and  $P_{2t}$  are the prices of goods 1 and 2, respectively,  $C_{\eta 1t}$  and  $C_{\eta 2t}$  are the goods produced in region 1 and 2, respectively, and consumed in region  $\eta$ . In the consumption aggregation,  $\omega_{\eta 1}$  and  $(1 - \omega_{\eta 1})$  are the weights of goods  $C_{\eta 1t}$  and  $C_{\eta 2t}$ , respectively, in the consumption bundle  $C_{\eta t}$ .

#### Lagrangian

The minimization problem with a constraint can be reformulated into one without a constraint by applying the Lagrangian function:

$$\mathcal{L} = P_{1t}C_{\eta 1t} + P_{2t}C_{\eta 2t} - Q_{\eta t}(C_{\eta 1t}^{\omega_{\eta 1}} C_{\eta 2t}^{1-\omega_{\eta 1}} - C_{\eta t}) \quad (3.3)$$

## First Order Conditions

The first order conditions are:

$$C_{\eta 1t} : P_{1t} - Q_{\eta t} \omega_{\eta 1} C_{\eta 1t}^{\omega_{\eta 1}-1} C_{\eta 2t}^{1-\omega_{\eta 1}} = 0 \implies C_{\eta 1t} = \frac{\omega_{\eta 1} Q_{\eta t} C_{\eta t}}{P_{1t}} \quad (3.4)$$

$$C_{\eta 2t} : P_{2t} - Q_{\eta t} (1 - \omega_{\eta 1}) C_{\eta 1t}^{\omega_{\eta 1}} C_{\eta 2t}^{-\omega_{\eta 1}} = 0 \implies C_{\eta 2t} = \frac{(1 - \omega_{\eta 1}) Q_{\eta t} C_{\eta t}}{P_{2t}} \quad (3.5)$$

$$Q_{\eta t} : C_{\eta t} = C_{\eta 1t}^{\omega_{\eta 1}} C_{\eta 2t}^{1-\omega_{\eta 1}} \quad (3.2)$$

## Solutions

Divide 3.5 by 3.4:

$$\begin{aligned} \frac{C_{\eta 2t}}{C_{\eta 1t}} &= \frac{(1 - \omega_{\eta 1}) Q_{\eta t} C_{\eta t} / P_{2t}}{\omega_{\eta 1} Q_{\eta t} C_{\eta t} / P_{1t}} \implies \\ C_{\eta 2t} &= C_{\eta 1t} \frac{(1 - \omega_{\eta 1}) P_{1t}}{\omega_{\eta 1} P_{2t}} \end{aligned} \quad (3.6)$$

Substitute 3.6 in 3.2:

$$\begin{aligned} C_{\eta t} &= C_{\eta 1t}^{\omega_{\eta 1}} \left[ C_{\eta 1t} \frac{(1 - \omega_{\eta 1}) P_{1t}}{\omega_{\eta 1} P_{2t}} \right]^{1-\omega_{\eta 1}} \implies \\ C_{\eta 1t} &= C_{\eta t} \left( \frac{P_{2t} \omega_{\eta 1}}{P_{1t} (1 - \omega_{\eta 1})} \right)^{1-\omega_{\eta 1}} \end{aligned} \quad (3.7)$$

Substitute 3.4 and 3.5 in 3.2:

$$\begin{aligned} C_{\eta t} &= \left( \frac{\omega_{\eta 1} Q_{\eta t} C_{\eta t}}{P_{1t}} \right)^{\omega_{\eta 1}} \left( \frac{(1 - \omega_{\eta 1}) Q_{\eta t} C_{\eta t}}{P_{2t}} \right)^{1-\omega_{\eta 1}} \implies \\ Q_{\eta t} &= \left( \frac{P_{1t}}{\omega_{\eta 1}} \right)^{\omega_{\eta 1}} \left( \frac{P_{2t}}{1 - \omega_{\eta 1}} \right)^{1-\omega_{\eta 1}} \end{aligned} \quad (3.8)$$

Divide 3.8 of region 1 by region 2:

$$\begin{aligned} \frac{Q_{1t}}{Q_{2t}} &= \frac{\left(\frac{P_{1t}}{\omega_{11}}\right)^{\omega_{11}} \left(\frac{P_{2t}}{1-\omega_{11}}\right)^{1-\omega_{11}}}{\left(\frac{P_{1t}}{\omega_{21}}\right)^{\omega_{21}} \left(\frac{P_{2t}}{1-\omega_{21}}\right)^{1-\omega_{21}}} \implies \\ \frac{Q_{1t}}{Q_{2t}} &= \frac{\omega_{21}^{\omega_{21}} (1-\omega_{21})^{1-\omega_{21}}}{\omega_{11}^{\omega_{11}} (1-\omega_{11})^{1-\omega_{11}}} \end{aligned} \quad (3.9)$$

Therefore, there is a consumption bundle  $C_{\eta t}$  and a consumption price index  $Q_{\eta t}$  that minimize the total consumption cost  $Q_{\eta t}C_{\eta t}$  for the household in region  $\eta$ . Notice that the cost problems of both regions are (must be) related, as the consumption level in one region influences the demand for goods in both regions. Now, this result will be used in the next problem that the household faces.

### Utility Maximization Problem

Following the models presented by [Costa Junior \(2016\)](#) and [Solis-Garcia \(2022\)](#), the representative household next problem is to maximize an intertemporal utility function  $U_\eta$  with respect to consumption  $C_{\eta t}$  and labor  $L_{\eta t}$ , subject to a budget constraint, a capital accumulation rule and the non-negativity of real variables:

$$\max_{C_{\eta t}, L_{\eta t}, B_{\eta t}} : U_\eta(C_{\eta t}, L_{\eta t}) = \mathbb{E}_t \sum_{t=0}^{\infty} \beta^t \left( \frac{C_{\eta t}^{1-\sigma}}{1-\sigma} - \phi \frac{L_{\eta t}^{1+\varphi}}{1+\varphi} \right) \quad (3.10)$$

$$\begin{aligned} \text{s. t. : } Q_{\eta t}C_{\eta t} + B_{\eta t} &= W_{\eta t}L_{\eta t} + (1 + R_{t-1})B_{\eta, t-1} + \Pi_{\eta t} \\ C_{\eta t}, L_{\eta t} &> 0 \end{aligned} \quad (3.11)$$

where  $\mathbb{E}_t$  is the expectation operator,  $\beta$  is the intertemporal discount factor,  $\sigma$  is the relative risk aversion coefficient,  $\phi$  is the relative labor weight in utility,  $\varphi$  is the marginal disutility of labor supply. In the budget constraint,  $P_{1t}$  and  $P_{2t}$  are the prices of goods 1 and 2, respectively,  $C_{\eta 1t}$  and  $C_{\eta 2t}$  are the goods produced in region 1 and 2, respectively, and consumed in region  $\eta$ ,  $B_{\eta t}$  are the bonds,  $W_{\eta t}$  is the wage level,  $R_t$  is the return on bonds (which is also the nominal interest rate of the economy) and  $\Pi_{\eta t}$  is the firm profit.

## Lagrangian

The maximization problem with restrictions can be transformed into one without restriction using the Lagrangian function  $\mathcal{L}$  formed by 3.10 and 3.11:

$$\begin{aligned} \mathcal{L} = \mathbb{E}_t \sum_{t=0}^{\infty} \beta^t & \left\{ \left( \frac{C_{\eta t}^{1-\sigma}}{1-\sigma} - \phi \frac{L_{\eta t}^{1+\varphi}}{1+\varphi} \right) - \right. \\ & \left. - \mu_{\eta t} [Q_{\eta t} C_{\eta t} + B_{\eta t} - (W_{\eta t} L_{\eta t} + (1+R_{t-1}) B_{\eta,t-1} + \Pi_{\eta t})] \right\} \end{aligned} \quad (3.12)$$

## First Order Conditions

The first order conditions are:

$$\begin{aligned} C_{\eta t} : \quad \beta^t \left\{ \frac{(1-\sigma)C_{\eta t}^{-\sigma}}{1-\sigma} - \mu_{\eta t} [Q_{\eta t}] \right\} = 0 \implies \\ \mu_{\eta t} = \frac{C_{\eta t}^{-\sigma}}{Q_{\eta t}} \end{aligned} \quad (3.13)$$

$$\begin{aligned} L_{\eta t} : \quad \beta^t \left\{ -\phi \frac{(1+\varphi)L_{\eta t}^{1+\varphi}}{1+\varphi} - \mu_{\eta t} [-W_{\eta t}] \right\} = 0 \implies \\ \mu_{\eta t} = \frac{\phi L_{\eta t}^{\varphi}}{W_{\eta t}} \end{aligned} \quad (3.14)$$

$$\begin{aligned} B_{\eta t} : \quad \beta^t \{-\mu_{\eta t}\} + \mathbb{E}_t \beta^{t+1} \{-\mu_{\eta,t+1}[-(1+R_t)]\} = 0 \implies \\ \mu_{\eta t} = \beta(1+R_t) \mathbb{E}_t \mu_{\eta,t+1} \end{aligned} \quad (3.15)$$

$$\mu_{\eta t} : \quad Q_{\eta t} C_{\eta t} + B_{\eta t} = W_{\eta t} L_{\eta t} + (1+R_{t-1}) B_{\eta,t-1} + \Pi_{\eta t} \quad (3.11)$$

## Solutions

Match 3.13 and 3.14:

$$\begin{aligned} \mu_{\eta t} = \frac{C_{\eta t}^{-\sigma}}{Q_{\eta t}} = \frac{\phi L_{\eta t}^{\varphi}}{W_{\eta t}} \implies \\ \frac{\phi L_{\eta t}^{\varphi}}{C_{\eta t}^{-\sigma}} = \frac{W_{\eta t}}{Q_{\eta t}} \end{aligned} \quad (3.16)$$

Equation 3.16 is the Household Labor Supply and shows that the marginal rate

of substitution (MRS) of labor for consumption is equal to the real wage, which is the relative price between labor and goods.

Substitute  $\mu_{\eta t}$  and  $\mu_{\eta, t+1}$  from equation 3.13 in 3.15:

$$\begin{aligned} \frac{C_{\eta t}^{-\sigma}}{Q_{\eta t}} &= \beta(1 + R_t) \mathbb{E}_t \left\{ \frac{C_{\eta, t+1}^{-\sigma}}{Q_{\eta, t+1}} \right\} \implies \\ \frac{\mathbb{E}_t \left\{ Q_{\eta, t+1} C_{\eta, t+1}^\sigma \right\}}{Q_{\eta t} C_{\eta t}^\sigma} &= \beta(1 + R_t) \end{aligned} \quad (3.17)$$

Equation 3.17 is the Euler equation for the bonds return.

Divide 3.17 of region one by region two:

$$\begin{aligned} \frac{\mathbb{E}_t \left\{ Q_{1,t+1} C_{1,t+1}^\sigma \right\}}{\mathbb{E}_t \left\{ Q_{2,t+1} C_{2,t+1}^\sigma \right\}} &= \frac{\beta(1 + R_t) Q_{1t} C_{1t}^\sigma}{\beta(1 + R_t) Q_{2t} C_{2t}^\sigma} \implies \\ \frac{\mathbb{E}_t \left\{ Q_{1,t+1} C_{1,t+1}^\sigma \right\}}{Q_{1t} C_{1t}^\sigma} &= \frac{\mathbb{E}_t \left\{ Q_{2,t+1} C_{2,t+1}^\sigma \right\}}{Q_{2t} C_{2t}^\sigma} \end{aligned} \quad (3.18)$$

## Firms

Consider two types of firms: (1) a continuum of intermediate-goods firms, which operate in monopolistic competition and each produce one variety with imperfect substitution level between each other and (2) the final-goods firm, which aggregates all these varieties into a final bundle and operates in perfect competition.

### 3.1.2 Final-Goods Firm

#### Profit Maximization Problem

The role of the final-goods firm is to aggregate all the varieties  $Y_{\eta jt}$  produced by the intermediate-goods firms in each region  $\eta \in \{1, 2\}$ , so that the representative consumer can buy only one good  $Y_{\eta t}$ , the bundle good, from each region.

The final-goods firm problem is to maximize its profit, considering that its output is the bundle  $Y_{\eta t}$  formed by a continuum  $j \in [0, 1]$  of intermediate goods  $Y_{\eta jt}$ , with

elasticity of substitution between intermediate goods  $\psi$ :

$$\max_{Y_{\eta jt}} : P_{\eta t} Y_{\eta t} - \int_0^1 P_{\eta jt} Y_{\eta jt} \, dj \quad (3.19)$$

$$\text{s. t. : } Y_{\eta t} = \left( \int_0^1 Y_{\eta jt}^{\frac{\psi-1}{\psi}} \, dj \right)^{\frac{\psi}{\psi-1}} \quad (3.20)$$

Substitute 3.20 in 3.19:

$$\max_{Y_{\eta jt}} : \Pi_{\eta t} = P_{\eta t} \left( \int_0^1 Y_{\eta jt}^{\frac{\psi-1}{\psi}} \, dj \right)^{\frac{\psi}{\psi-1}} - \int_0^1 P_{\eta jt} Y_{\eta jt} \, dj \quad (3.21)$$

### First Order Condition and Solutions

The first order condition is:

$$Y_{\eta jt} : P_{\eta t} \left( \frac{\psi}{\psi-1} \right) \left( \int_0^1 Y_{\eta jt}^{\frac{\psi-1}{\psi}} \, dj \right)^{\frac{\psi}{\psi-1}-1} \left( \frac{\psi-1}{\psi} \right) Y_{\eta jt}^{\frac{\psi-1}{\psi}-1} - P_{\eta jt} = 0 \implies \\ Y_{\eta jt} = Y_t \left( \frac{P_{\eta t}}{P_{\eta jt}} \right)^\psi \quad (3.22)$$

Equation 3.22 shows that the demand for variety  $j$  depends on its relative price.

Substitute 3.22 in 3.20:

$$Y_{\eta t} = \left( \int_0^1 Y_{\eta jt}^{\frac{\psi-1}{\psi}} \, dj \right)^{\frac{\psi}{\psi-1}} \implies \\ Y_{\eta t} = \left( \int_0^1 \left[ Y_{\eta t} \left( \frac{P_{\eta t}}{P_{\eta jt}} \right)^\psi \right]^{\frac{\psi-1}{\psi}} \, dj \right)^{\frac{\psi}{\psi-1}} \implies \\ P_{\eta t} = \left[ \int_0^1 P_{\eta jt}^{1-\psi} \, dj \right]^{\frac{1}{1-\psi}} \quad (3.23)$$

Equation 3.23 is the final-goods firm's markup.

### 3.1.3 Intermediate-Goods Firms

#### Cost Minimization Problem

The intermediate-goods firms, denoted by  $j \in [0, 1]$ , produce varieties of a representative good with a certain level of substitutability. Each of these firms has to choose labor  $L_{\eta jt}$  to minimize production costs, subject to a technology rule.

$$\min_{L_{\eta jt}} : W_{\eta t} L_{\eta jt} \quad (3.24)$$

$$\text{s. t. : } Y_{\eta jt} = Z_{A\eta t} L_{\eta jt} \quad (3.25)$$

where  $Y_{\eta jt}$  is the output obtained by the technology level  $Z_{A\eta t}$  that transforms labor  $L_{\eta jt}$  into intermediate goods, with constant returns to scale.<sup>5</sup>

#### Lagrangian

Transform the minimization problem with restriction into one without restriction applying the Lagrangian function  $\mathcal{L}$ :

$$\mathcal{L} = (W_{\eta t} L_{\eta jt}) - \Lambda_{\eta jt} (Z_{A\eta t} L_{\eta jt} - Y_{\eta jt}) \quad (3.26)$$

where the Lagrangian multiplier  $\Lambda_{\eta jt}$  is the marginal cost.<sup>6</sup>

#### First Order Condition

The first-order condition is:

$$L_{\eta jt} : W_{\eta t} - \Lambda_{\eta jt} Z_{A\eta t} = 0 \implies \Lambda_{\eta jt} = \frac{W_{\eta t}}{Z_{A\eta t}} \quad (3.27)$$

$$\Lambda_{\eta jt} : Y_{\eta jt} = Z_{A\eta t} L_{\eta jt} \quad (3.25)$$

<sup>5</sup> the production technology level  $Z_{A\eta t}$  will be submitted to a productivity shock, detailed in section 3.1.5.

<sup>6</sup> see Lemma A.1

As salaries and technology are the same for all firms in region  $\eta$ , the  $j$  index can be dropped from the marginal cost  $\Lambda$ :

$$\Lambda_{\eta t} = \frac{W_{\eta t}}{Z_{A\eta t}} \quad (3.28)$$

## Total and Marginal Costs

Notice that:

$$TC_{\eta jt} = W_{\eta t} L_{\eta jt} = \Lambda_{\eta t} Y_{\eta jt} \quad (3.29)$$

$$MC_{\eta jt} = \frac{\partial TC_{\eta jt}}{\partial Y_{\eta jt}} = \Lambda_{\eta t}$$

## Optimal Price Problem

Consider an economy with price stickiness, following the Calvo Rule ([CALVO, 1983](#)): each firm has a probability ( $0 < \theta < 1$ ) of keeping its price in the next period ( $P_{\eta j,t+1} = P_{\eta jt}$ ), and a probability ( $1 - \theta$ ) of setting a new optimal price  $P_{\eta jt}^*$  that maximizes its profits. Therefore, each firm must take this uncertainty into account when deciding the optimal price: the intertemporal profit flow, given the nominal interest rate  $R_t$  of each period, is calculated considering the probability  $\theta$  of keeping the previous price:

$$\max_{P_{\eta jt}} : \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s [P_{\eta jt} Y_{\eta j,t+s} - TC_{\eta j,t+s}]}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \quad (3.30)$$

$$\text{s. t. : } Y_{\eta jt} = Y_{\eta t} \left( \frac{P_{\eta t}}{P_{\eta jt}} \right)^\psi \quad (3.22)$$

Substitute [3.29](#) in [3.30](#):

$$\max_{P_{\eta jt}} : \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s [P_{\eta jt} Y_{\eta j,t+s} - \Lambda_{\eta,t+s} Y_{\eta j,t+s}]}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \quad (3.31)$$

Substitute 3.22 in 3.31 and rearrange the variables:

$$\begin{aligned} \max_{P_{\eta jt}} : \quad & \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s \left[ P_{\eta jt} Y_{\eta t+s} \left( \frac{P_{\eta,t+s}}{P_{\eta jt}} \right)^\psi - \Lambda_{\eta,t+s} Y_{\eta t+s} \left( \frac{P_{\eta,t+s}}{P_{\eta jt}} \right)^\psi \right]}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \Rightarrow \\ \max_{P_{\eta jt}} : \quad & \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s \left[ P_{\eta jt}^{1-\psi} P_{\eta,t+s}^\psi Y_{\eta t+s} - P_{\eta jt}^{-\psi} P_{\eta,t+s}^\psi Y_{\eta t+s} \Lambda_{\eta,t+s} \right]}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \end{aligned}$$

### First Order Condition

The first order condition with respect to  $P_{\eta jt}$  is:

$$\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s \left[ (1 - \psi) P_{\eta jt}^{-\psi} P_{\eta,t+s}^\psi Y_{\eta t+s} - (-\psi) P_{\eta jt}^{-\psi-1} P_{\eta,t+s}^\psi Y_{\eta t+s} \Lambda_{\eta,t+s} \right]}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} = 0$$

Separate the summations and rearrange the variables:

$$\begin{aligned} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s (\psi - 1) \left( \frac{P_{\eta,t+s}}{P_{\eta jt}} \right)^\psi Y_{\eta t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} &= \\ &= \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s \psi P_{\eta jt}^{-1} \left( \frac{P_{\eta,t+s}}{P_{\eta jt}} \right)^\psi Y_{\eta t+s} \Lambda_{\eta,t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \end{aligned} \tag{3.32}$$

Substitute 3.22 in 3.32:

$$\begin{aligned} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s (\psi - 1) Y_{\eta j,t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} &= \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s \psi P_{\eta jt}^{-1} Y_{\eta j,t+s} \Lambda_{\eta,t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \Rightarrow \\ (\psi - 1) \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s Y_{\eta j,t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} &= \psi P_{\eta jt}^{-1} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s Y_{\eta j,t+s} \Lambda_{\eta,t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \Rightarrow \\ P_{\eta jt} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s Y_{\eta j,t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} &= \frac{\psi}{\psi - 1} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s Y_{\eta j,t+s} \Lambda_{\eta,t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \Rightarrow \\ P_{\eta jt}^* &= \frac{\psi}{\psi - 1} \cdot \frac{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{\eta j,t+s} \Lambda_{\eta,t+s} / \prod_{k=0}^{s-1} (1 + R_{t+k}) \right\}}{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{\eta j,t+s} / \prod_{k=0}^{s-1} (1 + R_{t+k}) \right\}} \end{aligned} \tag{3.33}$$

Equation 3.33 represents the optimal price that firm  $j$  will choose. Since all firms that are able to choose will opt for the highest possible price, they will all select the same price. As a result, the index  $j$  can be omitted:

$$P_{\eta t}^* = \frac{\psi}{\psi - 1} \cdot \frac{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{\eta j, t+s} \Lambda_{\eta, t+s} / \prod_{k=0}^{s-1} (1 + R_{t+k}) \right\}}{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{\eta j, t+s} / \prod_{k=0}^{s-1} (1 + R_{t+k}) \right\}} \quad (3.34)$$

## Final-Goods Firm, part II

The process of fixing prices is random: in each period,  $\theta$  firms will maintain the price from the previous period, while  $(1 - \theta)$  firms will choose a new optimal price. The price level for each period will be a composition of these two prices. Use this information in 3.23 to determine the aggregate price level:

$$\begin{aligned} P_{\eta t} &= \left[ \int_0^\theta P_{\eta, t-1}^{1-\psi} dj + \int_\theta^1 P_{\eta t}^{*1-\psi} dj \right]^{\frac{1}{1-\psi}} \implies \\ P_{\eta t} &= \left[ \theta P_{\eta, t-1}^{1-\psi} + (1 - \theta) P_{\eta t}^{*1-\psi} \right]^{\frac{1}{1-\psi}} \end{aligned} \quad (3.35)$$

Equation 3.35 is the aggregate price level.

### 3.1.4 Monetary Authority

The objective of the monetary authority is to conduct the economy to price stability and economic growth, using a Taylor rule (TAYLOR, 1993) to determine the nominal interest rate:

$$\frac{R_t}{R} = \left( \frac{R_{t-1}}{R} \right)^{\gamma_R} \left[ \left( \frac{\pi_t}{\pi} \right)^{\gamma_\pi} \left( \frac{Y_t}{Y} \right)^{\gamma_Y} \right]^{1-\gamma_R} Z_{Mt} \quad (3.36)$$

where  $R, \pi, Y$  are the nominal interest rate, gross inflation rate and the production level in steady state, respectively;  $\gamma_R$  is the smoothing parameter for the interest rate  $R_{Kt}$ ,  $\gamma_\pi$  and  $\gamma_Y$  are the interest-rate sensitivities in relation to inflation and product,

respectively,  $Z_{Mt}$  is the monetary shock and  $\pi_t$  is the gross inflation rate, defined by:<sup>7</sup>

$$\pi_t = \pi_{1t}^{\theta_\pi} \pi_{2t}^{1-\theta_\pi} \quad (3.37)$$

$$\text{where: } \theta_\pi = \frac{P_{1t} Y_{1t}}{P_{1t} Y_{1t} + P_{2t} Y_{2t}} \quad (3.38)$$

## Regional Inflation

There is one price level  $P_{\eta t}$  in each region, generating a regional inflation rate:

$$\pi_{\eta t} = \frac{P_{\eta t}}{P_{\eta,t-1}} \quad (3.39)$$

### 3.1.5 Stochastic Shocks

#### Productivity Shock

The production technology level  $Z_{A\eta t}$  will be submitted to a productivity shock defined by a first-order autoregressive process  $AR(1)$ :

$$\ln Z_{A\eta t} = (1 - \rho_{A\eta}) \ln Z_{A\eta} + \rho_{A\eta} \ln Z_{A\eta,t-1} + \varepsilon_{A\eta t} \quad (3.40)$$

where  $\rho_{A\eta} \in [0, 1]$  and  $\varepsilon_{A\eta t} \sim \mathcal{N}(0, \sigma_{A\eta})$ .

#### Monetary Shock

The monetary policy will also be submitted to a shock, through the variable  $Z_{Mt}$ , defined by a first-order autoregressive process  $AR(1)$ :

$$\ln Z_{Mt} = (1 - \rho_M) \ln Z_M + \rho_M \ln Z_{M,t-1} + \varepsilon_{Mt} \quad (3.41)$$

where  $\rho_M \in [0, 1]$  and  $\varepsilon_{Mt} \sim \mathcal{N}(0, \sigma_M)$ .

---

<sup>7</sup> for the monetary shock definition, see section 3.1.5.

### 3.1.6 Equilibrium Conditions

A Competitive Equilibrium consists of sequences of prices  $\{P_{\eta t}^*, R_t^*, R_{Kt}^*, W_{\eta t}^*\}$ , allocations for households  $\mathcal{A}_H := \{C_{\eta 1t}^*, C_{\eta 2t}^*, L_{\eta t}^*, B_{\eta t}^*, K_{\eta,t+1}^*\}$  and allocations for firms  $\mathcal{A}_F := \{K_{\eta jt}^*, L_{\eta jt}^*, Y_{\eta jt}^*, Y_{\eta t}^*\}$ . In such an equilibrium, given the set of exogenous variables  $\{K_0, Z_{A\eta t}, Z_{Mt}\}$ , the elements in  $\mathcal{A}_H$  solve the household problem, while the elements in  $\mathcal{A}_F$  solve the firms' problems, and the markets for goods, labor and bonds clear:

$$Y_t = Y_{1t} + Y_{2t} \quad (3.42)$$

$$\text{where: } P_{\eta t} Y_{\eta t} = P_{1t} C_{1\eta t} + P_{2t} C_{2\eta t} + B_{\eta t} = Q_{\eta t} C_{\eta t} + B_{\eta t} \quad (3.43)$$

$$L_{\eta t} = \int_0^1 L_{\eta jt} \, dj \quad (3.44)$$

$$B_{1t} + B_{2t} = 0 \quad (3.45)$$

### Intermediate-Goods Firm Profit

For the sake of closure, the intermediate-goods firm profit must be defined:

$$\Pi_{\eta t} = \int_0^1 \Pi_{\eta jt} \, dj \quad (3.46)$$

$$\Pi_{\eta jt} = P_{\eta t} Y_{\eta jt} - W_{\eta t} L_{\eta jt} \quad (3.47)$$

Substitute 3.47 and 3.44 in 3.46:

$$\Pi_{\eta t} = P_{\eta t} \int_0^1 Y_{\eta jt} \, dj - W_{\eta t} L_{\eta t} \quad (3.48)$$

Substitute 3.48 in 3.11:

$$\begin{aligned} Q_{\eta t} C_{\eta t} + B_{\eta t} &= W_{\eta t} L_{\eta t} + (1 + R_{t-1}) B_{\eta,t-1} + P_{\eta t} \int_0^1 Y_{\eta jt} \, dj - W_{\eta t} L_{\eta t} \implies \\ Q_{\eta t} C_{\eta t} + B_{\eta t} &= (1 + R_{t-1}) B_{\eta,t-1} + P_{\eta t} \int_0^1 Y_{\eta jt} \, dj \end{aligned} \quad (3.49)$$

### 3.1.7 Model Structure

The model is composed of the preview solutions, forming a square system of 34 variables and equations, summarized as follows:

- Variables:

- from the household problem:  $\langle C_\eta \ L_\eta \ B_\eta \ C_{\eta 1} \ C_{\eta 2} \ Q_\eta \rangle$ ;
- from the final-goods firm problem:  $\langle Y_{\eta j} \ Y_\eta \ P_\eta \rangle$ ;
- from the intermediate-goods firm problems:  $\langle L_{\eta j} \ P_\eta^* \rangle$ ;
- from the monetary policy:  $\langle R \ \pi \ Y \rangle$ ;
- prices:  $\langle W_\eta \ \Lambda_\eta \ \pi_\eta \rangle$ ;
- shocks:  $\langle Z_{A\eta} \ Z_M \rangle$ .

- Equations:

1. Regional Consumption Weight:

$$C_{\eta 2t} = C_{\eta 1t} \frac{(1 - \omega_{\eta 1})P_{1t}}{\omega_{\eta 1}P_{2t}} \quad (3.6)$$

2. Regional Consumption of Good 1:

$$C_{\eta 1t} = C_{\eta t} \left( \frac{P_{2t}\omega_{\eta 1}}{P_{1t}(1 - \omega_{\eta 1})} \right)^{1-\omega_{\eta 1}} \quad (3.7)$$

3. Region 1 Price Index:

$$Q_{1t} = \left( \frac{P_{1t}}{\omega_{11}} \right)^{\omega_{11}} \left( \frac{P_{2t}}{1 - \omega_{11}} \right)^{1-\omega_{11}} \quad (3.8)$$

4. Regional Terms of Trade:

$$\frac{Q_{1t}}{Q_{2t}} = \frac{\omega_{21}^{\omega_{21}}(1 - \omega_{21})^{1-\omega_{21}}}{\omega_{11}^{\omega_{11}}(1 - \omega_{11})^{1-\omega_{11}}} \quad (3.9)$$

5. Labor Supply:

$$\frac{\phi L_{\eta t}^\varphi}{C_{\eta t}^{-\sigma}} = \frac{W_{\eta t}}{Q_{\eta t}} \quad (3.16)$$

6. Region 1 Euler equation for the bonds return:

$$\frac{\mathbb{E}_t \left\{ Q_{1,t+1} C_{1,t+1}^\sigma \right\}}{Q_{1t} C_{1t}^\sigma} = \beta(1 + R_t) \quad (3.17)$$

7. Euler equation for regional consumption:

$$\frac{\mathbb{E}_t \left\{ Q_{1,t+1} C_{1,t+1}^\sigma \right\}}{Q_{1t} C_{1t}^\sigma} = \frac{\mathbb{E}_t \left\{ Q_{2,t+1} C_{2,t+1}^\sigma \right\}}{Q_{2t} C_{2t}^\sigma} \quad (3.18)$$

8. Bundle Technology:

$$Y_{\eta t} = \left( \int_0^1 Y_{\eta j t}^{\frac{\psi-1}{\psi}} dj \right)^{\frac{\psi}{\psi-1}} \quad (3.20)$$

9. Production Function:

$$Y_{\eta j t} = Z_{A\eta t} L_{\eta j t} \quad (3.25)$$

10. Marginal Cost:

$$\Lambda_{\eta t} = \frac{W_{\eta t}}{Z_{A\eta t}} \quad (3.28)$$

11. Optimal Price:

$$P_{\eta t}^* = \frac{\psi}{\psi-1} \cdot \frac{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{\eta j, t+s} \Lambda_{\eta, t+s} / \prod_{k=0}^{s-1} (1 + R_{t+k}) \right\}}{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{\eta j, t+s} / \prod_{k=0}^{s-1} (1 + R_{t+k}) \right\}} \quad (3.34)$$

12. Regional Price Level:

$$P_{\eta t} = \left[ \theta P_{\eta, t-1}^{1-\psi} + (1-\theta) P_{\eta t}^{*1-\psi} \right]^{\frac{1}{1-\psi}} \quad (3.35)$$

13. Monetary Policy:

$$\frac{R_t}{R} = \left( \frac{R_{t-1}}{R} \right)^{\gamma_R} \left[ \left( \frac{\pi_t}{\pi} \right)^{\gamma_\pi} \left( \frac{Y_t}{Y} \right)^{\gamma_Y} \right]^{1-\gamma_R} Z_{Mt} \quad (3.36)$$

14. National Gross Inflation Rate:

$$\pi_t = \pi_{1t}^{\theta_\pi} \pi_{2t}^{1-\theta_\pi} \quad (3.37)$$

15. Regional Gross Inflation Rate:

$$\pi_{\eta t} = \frac{P_{\eta t}}{P_{\eta, t-1}} \quad (3.39)$$

16. Productivity Shock:

$$\ln Z_{A\eta t} = (1 - \rho_{A\eta}) \ln Z_{A\eta} + \rho_{A\eta} \ln Z_{A\eta, t-1} + \varepsilon_{A\eta t} \quad (3.40)$$

17. Monetary Shock:

$$\ln Z_{Mt} = (1 - \rho_M) \ln Z_M + \rho_M \ln Z_{M,t-1} + \varepsilon_{Mt} \quad (3.41)$$

18. Market Clearing Condition:

$$Y_t = Y_{1t} + Y_{2t} \quad (3.42)$$

19. Regional Market Clearing Condition:

$$P_{\eta t} Y_{\eta t} = Q_{\eta t} C_{\eta t} + B_{\eta t} \quad (3.43)$$

20. Labor Regional Market Clearing Condition:

$$L_{\eta t} = \int_0^1 L_{\eta jt} \, d j \quad (3.44)$$

21. Budget Constraint:

$$Q_{\eta t} C_{\eta t} + B_{\eta t} = (1 + R_{t-1}) B_{\eta,t-1} + P_{\eta t} \int_0^1 Y_{\eta jt} \, d j \quad (3.49)$$

### 3.2 Steady State

The steady state of a variable is defined by its constancy through time. For any given variable  $X_t$ , it is in steady state if  $\mathbb{E}_t X_{t+1} = X_t = X_{t-1} = X_{ss}$  ([COSTA JUNIOR, 2016](#), p.41). For conciseness, the  $ss$  index representing the steady state will be omitted, so that  $X := X_{ss}$ . The model in steady state is:

1. Regional Consumption Weight:

$$C_{\eta 2} = C_{\eta 1} \frac{(1 - \omega_{\eta 1})P_1}{\omega_{\eta 1} P_2} \quad (3.50)$$

2. Regional Consumption of Good 1:

$$C_{\eta 1} = C_\eta \left( \frac{P_2 \omega_{\eta 1}}{P_1 (1 - \omega_{\eta 1})} \right)^{1 - \omega_{\eta 1}} \quad (3.51)$$

3. Region 1 Price Index:

$$Q_1 = \left( \frac{P_1}{\omega_{11}} \right)^{\omega_{11}} \left( \frac{P_2}{1 - \omega_{11}} \right)^{1 - \omega_{11}} \quad (3.52)$$

4. Regional Terms of Trade:

$$\frac{Q_1}{Q_2} = \frac{\omega_{21}^{\omega_{21}} (1 - \omega_{21})^{1 - \omega_{21}}}{\omega_{11}^{\omega_{11}} (1 - \omega_{11})^{1 - \omega_{11}}} \quad (3.53)$$

5. Labor Supply:

$$\frac{\phi L_\eta^\varphi}{C_\eta^{-\sigma}} = \frac{W_\eta}{Q_\eta} \quad (3.54)$$

6. Region 1 Euler equation for the bonds return:

$$\begin{aligned} \frac{\mathbb{E}_t \{ Q_1 C_1^\sigma \}}{Q_1 C_1^\sigma} &= \beta(1 + R) \implies \\ 1 &= \beta(1 + R) \end{aligned} \quad (3.55)$$

7. Euler equation for regional consumption:

$$\frac{\mathbb{E}_t \{ Q_1 C_1^\sigma \}}{Q_1 C_1^\sigma} = \frac{\mathbb{E}_t \{ Q_2 C_2^\sigma \}}{Q_2 C_2^\sigma} = 1 \quad (3.56)$$

8. Bundle Technology:

$$Y_\eta = \left( \int_0^1 Y_{\eta j}^{\frac{\psi-1}{\psi}} dj \right)^{\frac{\psi}{\psi-1}} \quad (3.57)$$

9. Production Function:

$$Y_{\eta j} = Z_{A\eta} L_{\eta j} \quad (3.58)$$

10. Marginal Cost:

$$\Lambda_\eta = \frac{W_\eta}{Z_{A\eta}} \quad (3.59)$$

11. Optimal Price:

$$\begin{aligned} P_\eta^* &= \frac{\psi}{\psi-1} \cdot \frac{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{\eta j} \Lambda_\eta / \prod_{k=0}^{s-1} (1+R) \right\}}{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{\eta j} / \prod_{k=0}^{s-1} (1+R) \right\}} \implies \\ P_\eta^* &= \frac{\psi}{\psi-1} \Lambda_\eta \end{aligned} \quad (3.60)$$

12. Regional Price Level:

$$\begin{aligned} P_\eta &= \left[ \theta P_\eta^{1-\psi} + (1-\theta) P_\eta^{*\,1-\psi} \right]^{\frac{1}{1-\psi}} \implies \\ P_\eta &= P_\eta^* \end{aligned} \quad (3.61)$$

13. Monetary Policy:

$$\begin{aligned} \frac{R}{R} &= \left( \frac{R}{R} \right)^{\gamma_R} \left[ \left( \frac{\pi}{\pi} \right)^{\gamma_\pi} \left( \frac{Y}{Y} \right)^{\gamma_Y} \right]^{1-\gamma_R} Z_M \implies \\ Z_M &= 1 \end{aligned} \quad (3.62)$$

14. National Gross Inflation Rate:

$$\pi = \pi_1^{\theta_\pi} \pi_2^{1-\theta_\pi} \quad (3.63)$$

15. Regional Gross Inflation Rate:

$$\pi_\eta = \frac{P_\eta}{\bar{P}_\eta} = 1 \quad (3.64)$$

16. Productivity Shock:

$$\begin{aligned} \ln Z_{A\eta} &= (1 - \rho_{A\eta}) \ln Z_{A\eta} + \rho_{A\eta} \ln Z_{A\eta} + \varepsilon_{A\eta} \implies \\ \varepsilon_{A\eta} &= 0 \end{aligned} \quad (3.65)$$

17. Monetary Shock:

$$\begin{aligned} \ln Z_M &= (1 - \rho_M) \ln Z_M + \rho_M \ln Z_M + \varepsilon_M \implies \\ \varepsilon_M &= 0 \end{aligned} \quad (3.66)$$

18. Market Clearing Condition:

$$Y = Y_1 + Y_2 \quad (3.67)$$

19. Regional Market Clearing Condition:

$$P_\eta Y_\eta = Q_\eta C_\eta + B_\eta \quad (3.68)$$

20. Labor Regional Market Clearing Condition:

$$L_\eta = \int_0^1 L_{\eta j} \, dj \quad (3.69)$$

21. Budget Constraint:

$$Q_\eta C_\eta = RB_\eta + P_\eta \int_0^1 Y_{\eta j} \, dj \quad (3.70)$$

### 3.2.1 Variables at Steady State

For the steady state solution, all endogenous variables will be determined with respect to the parameters. It is assumed that one regional price level and one productivity level are equal to one. The other productivity level is a multiple of the first:<sup>8</sup>

$$\langle P_1 \ Z_{A1} \rangle = \vec{1} \quad (3.71)$$

$$\langle P_2 \ Z_{A2} \rangle = \langle \theta_P P_1 \ \theta_Z Z_{A1} \rangle \quad (3.72)$$

From 3.62, 3.63 and 3.64, the monetary shock, the national and regional gross inflation rates are:

$$\langle Z_M \ \pi \ \pi_1 \ \pi_2 \rangle = \vec{1} \quad (3.73)$$

From 3.65 and 3.66, the productivity and monetary shocks are:

$$\langle \varepsilon_{A1} \ \varepsilon_{A2} \ \varepsilon_M \rangle = \vec{0} \quad (3.74)$$

From 3.55, the return on bonds is:

$$1 = \beta(1 + R) \implies \quad (3.55)$$

$$R = \frac{1}{\beta} - 1 \quad (3.75)$$

From 3.61 and 3.71, the regional optimal price  $P_\eta^*$  is:

$$P_\eta^* = P_\eta \implies \langle P_1^* \ P_2^* \rangle = \langle P_1 \ P_2 \rangle = \langle P_1 \ \theta_P P_1 \rangle \quad (3.76)$$

Substitute 3.71 in 3.52 for the price composition of consumption bundle  $Q_\eta$ :

$$Q_1 = \left( \frac{P_1}{\omega_{11}} \right)^{\omega_{11}} \left( \frac{P_2}{1 - \omega_{11}} \right)^{1 - \omega_{11}} \implies \quad (3.52)$$

$$Q_1 = \frac{P_1 \theta_P^{1 - \omega_{11}}}{\omega_{11}^{\omega_{11}} (1 - \omega_{11})^{1 - \omega_{11}}} \quad (3.77)$$

<sup>8</sup> where  $\vec{1}$  is the unit vector.

Substitute 3.77 in 3.53:

$$Q_2 = Q_1 \frac{\omega_{11}^{\omega_{11}} (1 - \omega_{11})^{1-\omega_{11}}}{\omega_{21}^{\omega_{21}} (1 - \omega_{21})^{1-\omega_{21}}} \implies \quad (3.53)$$

$$Q_2 = \frac{P_1 \theta_P^{1-\omega_{11}}}{\omega_{21}^{\omega_{21}} (1 - \omega_{21})^{1-\omega_{21}}} \quad (3.78)$$

Substitute 3.76 in 3.60 for the marginal cost  $\Lambda_\eta$ :

$$P_\eta^* = \frac{\psi}{\psi - 1} \Lambda_\eta \implies \quad (3.60)$$

$$\Lambda_\eta = P_\eta \frac{\psi - 1}{\psi} \quad (3.79)$$

From 3.59, the nominal wage  $W_\eta$  is:

$$\Lambda_\eta = \frac{W_\eta}{Z_{A\eta}} \quad (3.59)$$

$$W_\eta = \Lambda_\eta Z_{A\eta} \quad (3.80)$$

Due to price parity in steady state, where prices are identical ( $P_\eta = P_\eta^*$ ) and resulting in a gross inflation level of one ( $\pi_\eta = 1$ ), all firms produce the same output level ( $\forall i, j \in [0, 1], Y_{\eta j} = Y_{\eta i}, i \neq j$ ) (SOLIS-GARCIA, 2022, Lecture 13, p.12). As a consequence, they uniformly demand the same amount of factors ( $\forall j \in [0, 1], L_{\eta j} = L_{\eta i}, j \neq i$ ), and 3.57, 3.69, 3.58 and 3.70 become:

$$Y_\eta = Y_{\eta j} \quad (3.81)$$

$$L_\eta = L_{\eta j} \quad (3.82)$$

$$Y_\eta = Z_{A\eta} L_\eta \quad (3.83)$$

$$B_\eta = 0 \quad (3.84)$$

Isolate  $C_\eta$  in 3.54 and then substitute 3.77 and 3.71:

$$\frac{\phi L_\eta^\varphi}{C_\eta^{-\sigma}} = \frac{W_\eta}{Q_\eta} \implies C_\eta^\sigma = \frac{W_\eta}{\phi L_\eta^\varphi Q_\eta} \implies C_\eta = a_\eta Y_\eta^{\frac{-\varphi}{\sigma}}$$
(3.85)

$$\text{where: } a_\eta = \left[ \frac{W_\eta Z_{A\eta}^\varphi}{\phi Q_\eta} \right]^{\frac{1}{\sigma}}$$
(3.86)

Substitute 3.85 and 3.84 in 3.68:

$$P_\eta Y_\eta = Q_\eta C_\eta + B_\eta \implies$$
(3.68)

$$P_\eta Y_\eta = Q_\eta a_\eta Y_\eta^{\frac{-\varphi}{\sigma}} \implies$$

$$Y_\eta = \left( \frac{Q_\eta a_\eta}{P_\eta} \right)^{\frac{\sigma}{\varphi+\sigma}}$$
(3.87)

The result of 3.87 determines  $Y, C_\eta, C_{\eta 1}, C_{\eta 2}, L_\eta$  in 3.67, 3.85, 3.51, 3.50, 3.83, respectively.

### 3.2.2 Steady State Solution

$$\vec{1} = \langle P_1 \ Z_{A1} \rangle \quad (3.71)$$

$$\langle P_2 \ Z_{A2} \rangle = \langle \theta_P P_1 \ \theta_Z Z_{A1} \rangle \quad (3.72)$$

$$\vec{1} = \langle Z_M \ \pi \ \pi_1 \ \pi_2 \rangle \quad (3.73)$$

$$\vec{0} = \langle \varepsilon_{A1} \ \varepsilon_{A2} \ \varepsilon_M \rangle \quad (3.74)$$

$$R = \frac{1}{\beta} - 1 \quad (3.75)$$

$$P_\eta^* = P_\eta \quad (3.76)$$

$$Q_1 = \frac{P_1 \theta_P^{1-\omega_{11}}}{\omega_{11}^{\omega_{11}} (1-\omega_{11})^{1-\omega_{11}}} \quad (3.77)$$

$$Q_2 = \frac{P_1 \theta_P^{1-\omega_{11}}}{\omega_{21}^{\omega_{21}} (1-\omega_{21})^{1-\omega_{21}}} \quad (3.78)$$

$$\Lambda_\eta = P_\eta \frac{\psi - 1}{\psi} \quad (3.79)$$

$$W_\eta = \Lambda_\eta Z_{A\eta} \quad (3.80)$$

$$B_\eta = 0 \quad (3.84)$$

$$a_\eta = \left[ \frac{W_\eta Z_{A\eta}^\varphi}{\phi Q_\eta} \right]^{\frac{1}{\sigma}} \quad (3.86)$$

$$Y_\eta = \left( \frac{Q_\eta a_\eta}{P_\eta} \right)^{\frac{\sigma}{\varphi+\sigma}} \quad (3.87)$$

$$Y = Y_1 + Y_2 \quad (3.67)$$

$$C_\eta = a_\eta Y_\eta^{-\frac{\varphi}{\sigma}} \quad (3.85)$$

$$C_{\eta 1} = C_\eta \left( \frac{P_2 \omega_{\eta 1}}{P_1 (1 - \omega_{\eta 1})} \right)^{1-\omega_{\eta 1}} \quad (3.51)$$

$$C_{\eta 2} = C_{\eta 1} \frac{(1 - \omega_{\eta 1}) P_1}{\omega_{\eta 1} P_2} \quad (3.50)$$

$$L_\eta = \frac{Y_\eta}{Z_{A\eta}} \quad (3.83)$$

### 3.3 Log-linearization

Due to the number of variables and equations to be solved, computational brute force will be necessary. Dynare is a software specialized on macroeconomic modeling, used for solving DSGE models. Before the model can be processed by the software, it must be linearized in order to eliminate the infinite sum in equation 3.34. For this purpose, Uhlig's rules of log-linearization (UHLIG, 1999) will be applied to all equations in the model.<sup>9</sup>

#### Regional Gross Inflation Rate

Log-linearize 3.39 and define the level deviation of regional inflation rate  $\hat{\pi}_{\eta t}$ :

$$\pi_{\eta t} = \frac{P_{\eta t}}{P_{\eta, t-1}} \quad (3.39)$$

$$\hat{\pi}_{\eta t} = \hat{P}_{\eta t} - \hat{P}_{\eta, t-1} \quad (3.88)$$

#### Regional Price Level

Log-linearize equation 3.35:

$$\begin{aligned} P_{\eta t}^{1-\psi} &= \theta P_{\eta, t-1}^{1-\psi} + (1-\theta) P_{\eta t}^{*1-\psi} \implies (3.35) \\ P^{1-\psi}(1 + (1-\psi)\hat{P}_{\eta t}) &= \theta P^{1-\psi}(1 + (1-\psi)\hat{P}_{\eta, t-1}) + \\ &\quad + (1-\theta) P^{1-\psi}(1 + (1-\psi)\hat{P}_{\eta t}^*) \implies \\ \hat{P}_{\eta t} &= \theta \hat{P}_{\eta, t-1} + (1-\theta) \hat{P}_{\eta t}^* \end{aligned} \quad (3.89)$$

<sup>9</sup> see lemma A.3 for details.

## New Keynesian Phillips Curve

In order to log-linearize equation 3.34, it is necessary to eliminate both the summation and the product operators. To handle the product operator, apply lemma A.5:

$$\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s P_{\eta t}^* Y_{\eta j, t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} = \frac{\psi}{\psi - 1} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s Y_{\eta j, t+s} \Lambda_{\eta, t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \implies \quad (3.34)$$

$$\begin{aligned} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s P_{\eta t}^* Y_{\eta j, t+s}}{(1+R)^s \left( 1 + \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right)} \right\} &= \\ &= \frac{\psi}{\psi - 1} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s Y_{\eta j, t+s} \Lambda_{\eta, t+s}}{(1+R)^s \left( 1 + \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right)} \right\} \end{aligned} \quad (3.90)$$

First, log-linearize the left hand side of equation 3.90 with respect to  $P_{\eta t}^*, Y_{\eta j}, \tilde{R}_t$ :

$$\begin{aligned} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s P_{\eta t}^* Y_{\eta j, t+s}}{(1+R)^s \left( 1 + \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right)} \right\} &\implies \\ \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \frac{P_{\eta}^* Y_{\eta j} \left( 1 + \hat{P}_{\eta t}^* + \hat{Y}_{\eta j, t+s} \right)}{1 + \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k}} \right\} &\implies \\ P_{\eta}^* Y_{\eta j} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \left( 1 + \hat{P}_{\eta t}^* + \hat{Y}_{\eta j, t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\} \end{aligned}$$

Separate the terms not dependent on  $s$ :

$$\begin{aligned} P_{\eta}^* Y_{\eta j} (1 + \hat{P}_{\eta t}^*) \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \right\} + \\ + P_{\eta}^* Y_{\eta j} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \left( \hat{Y}_{\eta j, t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\} \implies \end{aligned}$$

Apply definition A.9 on the first term:

$$\frac{P_{\eta}^* Y_{\eta j} (1 + \hat{P}_{\eta t}^*)}{1 - \theta / (1+R)} + P_{\eta}^* Y_{\eta j} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \left( \hat{Y}_{\eta j, t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\}$$

Second, log-linearize the left hand side of 3.90 with respect to  $\Lambda_{\eta t}^*$ ,  $Y_{\eta j t}$ ,  $\tilde{R}_t$ :

$$\begin{aligned} \frac{\psi}{\psi-1} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s Y_{\eta j, t+s} \Lambda_{\eta, t+s}}{(1+R)^s \left( 1 + \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right)} \right\} &\implies \\ \frac{\psi}{\psi-1} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \frac{Y_{\eta j} \Lambda_{\eta} (1 + \hat{Y}_{\eta j, t+s} + \hat{\Lambda}_{\eta, t+s})}{1 + \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k}} \right\} &\implies \\ \frac{\psi}{\psi-1} Y_{\eta j} \Lambda_{\eta} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \left( 1 + \hat{Y}_{\eta j, t+s} + \hat{\Lambda}_{\eta, t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\} \end{aligned}$$

Separate the terms not dependent on  $s$ :

$$\begin{aligned} \frac{\psi}{\psi-1} Y_{\eta j} \Lambda_{\eta} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \right\} + \\ + \frac{\psi}{\psi-1} Y_{\eta j} \Lambda_{\eta} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \left( \hat{Y}_{\eta j, t+s} + \hat{\Lambda}_{\eta, t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\} \end{aligned}$$

Apply definition A.9 on the first term:

$$\begin{aligned} \frac{\psi}{\psi-1} \cdot \frac{Y_{\eta j} \Lambda_{\eta}}{1 - \theta/(1+R)} + \\ + \frac{\psi}{\psi-1} Y_{\eta j} \Lambda_{\eta} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \left( \hat{Y}_{\eta j, t+s} + \hat{\Lambda}_{\eta, t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\} \end{aligned}$$

Join both sides of the equation again:

$$\begin{aligned} \frac{P_{\eta}^* Y_{\eta j} (1 + \hat{P}_{\eta t}^*)}{1 - \theta/(1+R)} + P_{\eta}^* Y_{\eta j} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \left( \hat{Y}_{\eta j, t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\} = \\ = \frac{\psi}{\psi-1} \cdot \frac{Y_{\eta j} \Lambda_{\eta}}{1 - \theta/(1+R)} + \\ + \frac{\psi}{\psi-1} Y_{\eta j} \Lambda_{\eta} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \left( \hat{Y}_{\eta j, t+s} + \hat{\Lambda}_{\eta, t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\} \quad (3.91) \end{aligned}$$

Substitute 3.55 in 3.91:

$$\beta = \frac{1}{(1+R)} \quad (3.55)$$

$$\begin{aligned} & \frac{P_\eta^* Y_{\eta j} (1 + \hat{P}_{\eta t}^*)}{1 - \theta \beta} + P_\eta^* Y_{\eta j} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ (\theta \beta)^s \left( \hat{Y}_{\eta j, t+s} - \beta \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\} = \\ & = \frac{\psi}{\psi - 1} \cdot \frac{Y_{\eta j} \Lambda_\eta}{1 - \theta \beta} + \\ & + \frac{\psi}{\psi - 1} Y_{\eta j} \Lambda_\eta \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ (\theta \beta)^s \left( \hat{Y}_{\eta j, t+s} + \hat{\Lambda}_{\eta, t+s} - \beta \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\} \end{aligned} \quad (3.92)$$

Substitute 3.79 in 3.92 and simplify all common terms:

$$\begin{aligned} & \cancel{\frac{P_\eta^* Y_{\eta j}}{1 - \theta \beta}} + \cancel{\frac{P_\eta^* Y_{\eta j} \hat{P}_{\eta t}^*}{1 - \theta \beta}} + \cancel{P_\eta^* Y_{\eta j} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ (\theta \beta)^s \left( \hat{Y}_{\eta j, t+s} - \beta \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\}} = \\ & = \cancel{\frac{P_\eta^* Y_{\eta j}}{1 - \theta \beta}} + \cancel{P_\eta^* Y_{\eta j} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ (\theta \beta)^s \left( \hat{Y}_{\eta j, t+s} - \beta \sum_{k=0}^{s-1} \tilde{R}_{t+k} + \hat{\Lambda}_{\eta, t+s} \right) \right\}} \implies \\ & \frac{\hat{P}_{\eta t}^*}{1 - \theta \beta} = \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ (\theta \beta)^s (\hat{\Lambda}_{\eta, t+s}) \right\} \end{aligned} \quad (3.93)$$

Define the real marginal cost  $\lambda_{\eta t}$  and log-linearize it:

$$\lambda_{\eta t} = \frac{\Lambda_{\eta t}}{P_{\eta t}} \implies \Lambda_{\eta t} = P_{\eta t} \lambda_{\eta t} \implies \quad (3.94)$$

$$\hat{\Lambda}_{\eta t} = \hat{P}_{\eta t} + \hat{\lambda}_{\eta t} \quad (3.95)$$

Substitute 3.95 in 3.93:

$$\hat{P}_{\eta t}^* = (1 - \theta \beta) \mathbb{E}_t \sum_{s=0}^{\infty} (\theta \beta)^s (\hat{P}_{\eta, t+s} + \hat{\Lambda}_{\eta, t+s}) \quad (3.96)$$

Substitute 3.96 in 3.89:

$$\hat{P}_{\eta t} = \theta \hat{P}_{\eta, t-1} + (1 - \theta) \hat{P}_{\eta t}^* \quad (3.89)$$

$$\hat{P}_{\eta t} = \theta \hat{P}_{\eta, t-1} + (1 - \theta)(1 - \theta \beta) \mathbb{E}_t \sum_{s=0}^{\infty} (\theta \beta)^s (\hat{P}_{\eta, t+s} + \hat{\Lambda}_{\eta, t+s}) \quad (3.97)$$

Finally, to eliminate the summation, apply the lead operator  $(1 - \theta\beta\mathbb{L}^{-1})$  in 3.97:<sup>10</sup>

$$\begin{aligned}
(1 - \theta\beta\mathbb{L}^{-1})\hat{P}_{\eta t} &= (1 - \theta\beta\mathbb{L}^{-1}) \left[ \theta\hat{P}_{\eta,t-1} + \right. \\
&\quad \left. + (1 - \theta)(1 - \theta\beta)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\beta)^s (\hat{P}_{\eta,t+s} + \hat{\lambda}_{\eta,t+s}) \right] \implies \\
\hat{P}_{\eta t} - \theta\beta\mathbb{E}_t\hat{P}_{t+1} &= \theta\hat{P}_{\eta,t-1} - \theta\beta\theta\hat{P}_{\eta t} + \\
&\quad (1 - \theta)(1 - \theta\beta)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\beta)^s (\hat{P}_{\eta,t+s} + \hat{\lambda}_{\eta,t+s}) - \\
&\quad - \theta\beta(1 - \theta)(1 - \theta\beta)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\beta)^s (\hat{P}_{t+s+1} + \hat{\lambda}_{\eta,t+s+1}) \tag{3.98}
\end{aligned}$$

In the first summation, factor out the first term and in the second summation, include the term  $\theta\beta$  within the operator. Then, cancel the summations and rearrange the terms:

$$\begin{aligned}
\hat{P}_{\eta t} - \theta\beta\mathbb{E}_t\hat{P}_{t+1} &= \theta\hat{P}_{\eta,t-1} - \theta\beta\theta\hat{P}_{\eta t} + \\
&\quad (1 - \theta)(1 - \theta\beta)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\beta)^s (\hat{P}_{\eta,t+s} + \hat{\lambda}_{\eta,t+s}) - \\
&\quad - \theta\beta(1 - \theta)(1 - \theta\beta)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\beta)^s (\hat{P}_{t+s+1} + \hat{\lambda}_{\eta,t+s+1}) \implies \\
\hat{P}_{\eta t} - \theta\beta\mathbb{E}_t\hat{P}_{t+1} &= \theta\hat{P}_{\eta,t-1} - \theta\beta\theta\hat{P}_{\eta t} + (1 - \theta)(1 - \theta\beta)(\hat{P}_{\eta t} + \hat{\lambda}_{\eta t}) + \\
&\quad + (1 - \theta)(1 - \theta\beta)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\beta)^{s+1} (\hat{P}_{t+s+1} + \hat{\lambda}_{\eta,t+s+1}) - \\
&\quad - (1 - \theta)(1 - \theta\beta)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\beta)^{s+1} (\hat{P}_{t+s+1} + \hat{\lambda}_{\eta,t+s+1}) \implies \\
\hat{P}_{\eta t} - \theta\beta\mathbb{E}_t\hat{P}_{t+1} &= \theta\hat{P}_{\eta,t-1} - \theta^2\beta\hat{P}_{\eta t} + \\
&\quad + (1 - \theta - \theta\beta + \theta^2\beta)\hat{P}_{\eta t} + (1 - \theta)(1 - \theta\beta)\hat{\lambda}_{\eta t} \implies \\
(\hat{P}_{\eta t} - \hat{P}_{\eta,t-1}) &= \beta(\mathbb{E}_t\hat{P}_{t+1} - \hat{P}_{\eta t}) + \frac{(1 - \theta)(1 - \theta\beta)}{\theta}\hat{\lambda}_{\eta t} \tag{3.99}
\end{aligned}$$

---

<sup>10</sup> see definition A.10.

Substitute 3.88 in 3.99:

$$\hat{\pi}_{\eta t} = \beta \mathbb{E}_t \hat{\pi}_{\eta,t+1} + \frac{(1-\theta)(1-\theta\beta)}{\theta} \hat{\lambda}_{\eta t} \quad (3.100)$$

Equation 3.100 is the New Keynesian Phillips Curve in terms of the real marginal cost. It illustrates that the deviation of inflation depends on both the expectation of future inflation deviation and the present marginal cost deviation.

### Regional Consumption Weight

Log-linearize 3.6:

$$C_{\eta 2t} = C_{\eta 1t} \frac{(1 - \omega_{\eta 1}) P_{1t}}{\omega_{\eta 1} P_{2t}} \implies \hat{C}_{\eta 2t} - \hat{C}_{\eta 1t} = \hat{P}_{1t} - \hat{P}_{2t} \quad (3.6) \quad (3.101)$$

### Regional Consumption of Good 1

Log-linearize 3.7:

$$C_{\eta 1t} = C_{\eta t} \left( \frac{P_{2t} \omega_{\eta 1}}{P_{1t} (1 - \omega_{\eta 1})} \right)^{1 - \omega_{\eta 1}} \implies \hat{C}_{\eta t} - \hat{C}_{\eta 1t} = (1 - \omega_{\eta 1})(\hat{P}_{1t} - \hat{P}_{2t}) \quad (3.7) \quad (3.102)$$

### Region 1 Price Index

Log-linearize 3.8:

$$Q_{1t} = \left( \frac{P_{1t}}{\omega_{11}} \right)^{\omega_{11}} \left( \frac{P_{2t}}{1 - \omega_{11}} \right)^{1 - \omega_{11}} \implies \hat{Q}_{1t} = \omega_{11} \hat{P}_{1t} + (1 - \omega_{11}) \hat{P}_{2t} \quad (3.8) \quad (3.103)$$

## Regional Terms of Trade

Log-linearize 3.9:

$$\hat{Q}_{1t} = \hat{Q}_{2t} \quad (3.104)$$

## Labor Supply

Log-linearize 3.16 and then substitute 3.104:

$$\frac{\phi L_{\eta t}^\varphi}{C_{\eta t}^{-\sigma}} = \frac{W_{\eta t}}{Q_{\eta t}} \implies \quad (3.16)$$

$$\varphi \hat{L}_{\eta t} + \sigma \hat{C}_{\eta t} = \hat{W}_{\eta t} - \hat{Q}_{1t} \quad (3.105)$$

## Region 1 Euler equation for the bonds return

Log-linearize 3.17:

$$\frac{\mathbb{E}_t \left\{ Q_{1,t+1} C_{1,t+1}^\sigma \right\}}{Q_{1t} C_{1t}^\sigma} = \beta(1 + R_t) \implies \quad (3.17)$$

$$\hat{Q}_{1,t+1} - \hat{Q}_{1t} + \sigma(\hat{C}_{1,t+1} - \hat{C}_{1t}) = (1 - \beta)\hat{R}_t \quad (3.106)$$

## Euler equation for regional consumption

Log-linearize 3.17 and then substitute 3.104:

$$\frac{\mathbb{E}_t \left\{ Q_{1,t+1} C_{1,t+1}^\sigma \right\}}{Q_{1t} C_{1t}^\sigma} = \frac{\mathbb{E}_t \left\{ Q_{2,t+1} C_{2,t+1}^\sigma \right\}}{Q_{2t} C_{2t}^\sigma} \implies \quad (3.18)$$

$$\begin{aligned} \hat{Q}_{1,t+1} - \hat{Q}_{1t} + \sigma(\hat{C}_{1,t+1} - \hat{C}_{1t}) &= \\ &= \hat{Q}_{2,t+1} - \hat{Q}_{2t} + \sigma(\hat{C}_{2,t+1} - \hat{C}_{2t}) \implies \\ \hat{C}_{1,t+1} - \hat{C}_{1t} &= \hat{C}_{2,t+1} - \hat{C}_{2t} \end{aligned} \quad (3.107)$$

## Bundle Technology

Apply the natural logarithm to 3.20:

$$Y_{\eta t} = \left( \int_0^1 Y_{\eta jt}^{\frac{\psi-1}{\psi}} dj \right)^{\frac{\psi}{\psi-1}} \implies \ln Y_{\eta t} = \frac{\psi}{\psi-1} \ln \left( \int_0^1 Y_{\eta jt}^{\frac{\psi-1}{\psi}} dj \right) \quad (3.20)$$

Log-linearize using corollary A.3.1:

$$\begin{aligned} \ln Y_\eta + \hat{Y}_{\eta t} &= \frac{\psi}{\psi-1} \left[ \ln \left( \int_0^1 Y_{\eta j}^{\frac{\psi-1}{\psi}} dj \right) + \frac{\psi-1}{\psi} \int_0^1 \hat{Y}_{\eta jt} dj \right] \implies \\ \ln Y_\eta + \hat{Y}_{\eta t} &= \frac{\psi}{\psi-1} \left[ \ln \left( Y_{\eta j}^{\frac{\psi-1}{\psi}} \int_0^1 dj \right) + \frac{\psi-1}{\psi} \int_0^1 \hat{Y}_{\eta jt} dj \right] \implies \\ \ln Y_\eta + \hat{Y}_{\eta t} &= \cancel{\frac{\psi}{\psi-1}} \left[ \cancel{\frac{\psi-1}{\psi}} \ln Y_{\eta j} + \ln 1 + \cancel{\frac{\psi-1}{\psi}} \int_0^1 \hat{Y}_{\eta jt} dj \right] \implies \\ \ln Y_\eta + \hat{Y}_{\eta t} &= \ln Y_{\eta j} + \int_0^1 \hat{Y}_{\eta jt} dj \end{aligned}$$

Apply corollary A.2.1:

$$\begin{aligned} \ln Y_\eta + \hat{Y}_{\eta t} &= \ln Y_{\eta j} + \int_0^1 \hat{Y}_{\eta jt} dj \implies \\ \hat{Y}_{\eta t} &= \int_0^1 \hat{Y}_{\eta jt} dj \end{aligned} \quad (3.108)$$

## Production Function

Log-linearize 3.25:

$$Y_{\eta jt} = Z_{A\eta t} L_{\eta jt} \implies \quad (3.25)$$

$$\hat{Y}_{\eta jt} = \hat{Z}_{A\eta t} + \hat{L}_{\eta jt} \quad (3.109)$$

Substitute 3.109 in 3.108:

$$\hat{Y}_{\eta t} = \int_0^1 \hat{Y}_{\eta jt} \, dj \implies \quad (3.108)$$

$$\hat{Y}_{\eta t} = \hat{Z}_{A\eta t} + \int_0^1 \hat{L}_{\eta jt} \, dj \quad (3.110)$$

Apply the natural logarithm and then log-linearize 3.44:

$$\begin{aligned} L_{\eta t} &= \int_0^1 L_{\eta jt} \, dj \implies \quad (3.44) \\ \ln L_{\eta t} &= \ln \left[ \int_0^1 L_{\eta jt} \, dj \right] \implies \\ \ln L + \hat{L}_{\eta t} &= \ln \left[ \int_0^1 L_{\eta j} \, dj \right] + \int_0^1 \hat{L}_{\eta jt} \, dj \implies \\ \ln L + \hat{L}_{\eta t} &= \ln L_{\eta j} + \ln 1 + \int_0^1 \hat{L}_{\eta jt} \, dj \end{aligned}$$

Apply corollary A.2.1:

$$\implies \hat{L}_{\eta t} = \int_0^1 \hat{L}_{\eta jt} \, dj \quad (3.111)$$

Substitute 3.111 in 3.110:

$$\hat{Y}_{\eta t} = \hat{Z}_{A\eta t} + \hat{L}_{\eta t} \quad (3.112)$$

## Marginal Cost

Log-linearize 3.28 and then substitute 3.95:

$$\Lambda_{\eta t} = \frac{W_{\eta t}}{Z_{A\eta t}} \implies \quad (3.28)$$

$$\begin{aligned} \hat{\Lambda}_{\eta t} &= \hat{W}_{\eta t} - \hat{Z}_{A\eta t} \implies \\ \hat{P}_{\eta t} + \hat{\lambda}_{\eta t} &= \hat{W}_{\eta t} - \hat{Z}_{A\eta t} \quad (3.113) \end{aligned}$$

## Monetary Policy

Log-linearize 3.36:

$$\frac{R_t}{R} = \frac{R_{t-1}^{\gamma_R} (\pi_t^{\gamma_\pi} Y_t^{\gamma_Y})^{(1-\gamma_R)} Z_{Mt}}{R^{\gamma_R} (\pi^{\gamma_\pi} Y^{\gamma_Y})^{(1-\gamma_R)}} \implies \quad (3.36)$$

$$\begin{aligned} \frac{R(1 + \hat{R}_t)}{R} &= \frac{R^{\gamma_R} (\pi^{\gamma_\pi} Y^{\gamma_Y})^{(1-\gamma_R)} Z_M}{R^{\gamma_R} (\pi^{\gamma_\pi} Y^{\gamma_Y})^{(1-\gamma_R)}} \\ &\cdot [1 + \gamma_R \hat{R}_{t-1} + (1 - \gamma_R)(\gamma_\pi \hat{\pi}_t + \gamma_Y \hat{Y}_t) + \hat{Z}_{Mt}] \implies \\ \hat{R}_t &= \gamma_R \hat{R}_{t-1} + (1 - \gamma_R)(\gamma_\pi \hat{\pi}_t + \gamma_Y \hat{Y}_t) + \hat{Z}_{Mt} \end{aligned} \quad (3.114)$$

## National Gross Inflation Rate

Log-linearize 3.37:

$$\pi_t = \pi_{1t}^{\theta_\pi} \pi_{2t}^{1-\theta_\pi} \implies \quad (3.37)$$

$$\hat{\pi}_t = \theta_\pi \hat{\pi}_{1t} + (1 - \theta_\pi) \hat{\pi}_{2t} \quad (3.115)$$

## Productivity Shock

Log-linearize 3.40:

$$\begin{aligned} \ln Z_{A\eta t} &= (1 - \rho_{A\eta}) \ln Z_{A\eta} + \rho_{A\eta} \ln Z_{A\eta,t-1} + \varepsilon_{A\eta t} \implies \quad (3.40) \\ \ln Z_{A\eta} + \hat{Z}_{A\eta t} &= (1 - \rho_{A\eta}) \ln Z_{A\eta} + \rho_{A\eta} (\ln Z_{A\eta} + \hat{Z}_{A\eta,t-1}) + \varepsilon_{A\eta t} \implies \\ \hat{Z}_{A\eta t} &= \rho_{A\eta} \hat{Z}_{A\eta,t-1} + \varepsilon_{A\eta t} \end{aligned} \quad (3.116)$$

## Monetary Shock

Log-linearize 3.41:

$$\begin{aligned} \ln Z_{Mt} &= (1 - \rho_M) \ln Z_M + \rho_M \ln Z_{M,t-1} + \varepsilon_{Mt} \implies \quad (3.41) \\ \ln Z_M + \hat{Z}_{Mt} &= (1 - \rho_M) \ln Z_M + \rho_M (\ln Z_M + \hat{Z}_{M,t-1}) + \varepsilon_{Mt} \implies \\ \hat{Z}_{Mt} &= \rho_M \hat{Z}_{M,t-1} + \varepsilon_{Mt} \end{aligned} \quad (3.117)$$

## Market Clearing Condition

Log-linearize 3.42:

$$Y_t = Y_{1t} + Y_{2t} \quad (3.42)$$

$$Y(1 + \hat{Y}_t) = Y_1(1 + \hat{Y}_{1t}) + Y_2(1 + \hat{Y}_{2t}) \implies$$

$$\hat{Y}_t = \frac{Y_1}{Y} \hat{Y}_{1t} + \frac{Y_2}{Y} \hat{Y}_{2t} \quad (3.118)$$

Define the regional weights  $\langle \theta_Y \ (1 - \theta_Y) \rangle$  in the production total:

$$\langle \theta_Y \ (1 - \theta_Y) \rangle := \left\langle \frac{Y_1}{Y} \ \frac{Y_2}{Y} \right\rangle \quad (3.119)$$

Substitute 3.119 in 3.118:

$$\hat{Y}_t = \theta_Y \hat{Y}_{1t} + (1 - \theta_Y) \hat{Y}_{2t} \quad (3.120)$$

## Regional Market Clearing Condition

Log-linearize 3.43 and then substitute 3.104:

$$P_{\eta t} Y_{\eta t} = Q_{\eta t} C_{\eta t} + B_{\eta t} \implies \quad (3.43)$$

$$\hat{P}_{\eta t} + \hat{Y}_{\eta t} = \frac{Q_{\eta t} C_{\eta t}}{P_{\eta t} Y_{\eta t}} (\hat{Q}_{1t} + \hat{C}_{\eta t}) + \frac{B_{\eta t}}{P_{\eta t} Y_{\eta t}} \hat{B}_{\eta t} \quad (3.121)$$

Define bond and consumption weights on total expenses as  $\langle \theta_{B\eta} \ (1 - \theta_{B\eta}) \rangle$ :

$$\langle \theta_{B\eta} \ (1 - \theta_{B\eta}) \rangle := \left\langle \frac{B_{\eta t}}{P_{\eta t} Y_{\eta t}} \ \frac{Q_{\eta t} C_{\eta t}}{P_{\eta t} Y_{\eta t}} \right\rangle \quad (3.122)$$

Substitute 3.122 in 3.121:

$$\hat{P}_{\eta t} + \hat{Y}_{\eta t} = \theta_{B\eta} (\hat{Q}_{1t} + \hat{C}_{\eta t}) + (1 - \theta_{B\eta}) \hat{B}_{\eta t} \quad (3.123)$$

## Budget Constraint

Log-linearize 3.49 and then substitute 3.81, 3.84 and 3.104:

$$Q_{\eta t} C_{\eta t} + B_{\eta t} = (1 + R_{t-1}) B_{\eta, t-1} + P_{\eta t} \int_0^1 Y_{\eta j t} d j \implies \quad (3.49)$$

$$\hat{P}_{\eta t} + \hat{Y}_{\eta t} = \hat{Q}_{1t} + \hat{C}_{\eta t} \quad (3.124)$$

Substitute 3.121 in 3.123:

$$\hat{Q}_{1t} = \hat{B}_{\eta t} - \hat{C}_{\eta t} \quad (3.125)$$

Equation 3.125 demonstrates that the variation on the price level composition will affect the variation of consumption levels.

### 3.3.1 Log-linear Model Structure

The log-linear model is a square system of 25 variables and equations, summarized as follows:

- Variables:
- Real Variables:  $\langle \hat{C}_\eta \hat{L}_\eta \hat{C}_{\eta 1} \hat{C}_{\eta 2} \hat{Y}_\eta \hat{Y} \hat{Z}_{A\eta} \hat{Z}_M \rangle$ ;
- Nominal Variables:  $\langle \hat{Q}_1 \hat{P}_\eta \hat{R} \hat{\pi} \hat{W}_\eta \hat{\lambda}_\eta \hat{\pi}_\eta \rangle$ .
- Equations:

1. Regional Gross Inflation Rate

$$\hat{\pi}_{\eta t} = \hat{P}_{\eta t} - \hat{P}_{\eta, t-1} \quad (3.88)$$

2. New Keynesian Phillips Curve

$$\hat{\pi}_{\eta t} = \beta \mathbb{E}_t \hat{\pi}_{\eta, t+1} + \frac{(1-\theta)(1-\theta\beta)}{\theta} \hat{\lambda}_{\eta t} \quad (3.100)$$

3. Regional Consumption Weight

$$\hat{C}_{\eta 2t} - \hat{C}_{\eta 1t} = \hat{P}_{1t} - \hat{P}_{2t} \quad (3.101)$$

4. Regional Consumption of Good 1

$$\hat{C}_{\eta t} - \hat{C}_{\eta 1t} = (1 - \omega_{\eta 1})(\hat{P}_{1t} - \hat{P}_{2t}) \quad (3.102)$$

5. Region 1 Price Index

$$\hat{Q}_{1t} = \omega_{11} \hat{P}_{1t} + (1 - \omega_{11}) \hat{P}_{2t} \quad (3.103)$$

6. Labor Supply

$$\varphi \hat{L}_{\eta t} + \sigma \hat{C}_{\eta t} = \hat{W}_{\eta t} - \hat{Q}_{1t} \quad (3.105)$$

7. Region 1 Euler equation for the bonds return

$$\hat{Q}_{1,t+1} - \hat{Q}_{1t} + \sigma(\hat{C}_{1,t+1} - \hat{C}_{1t}) = (1 - \beta) \hat{R}_t \quad (3.106)$$

8. Euler equation for regional consumption

$$\hat{C}_{1,t+1} - \hat{C}_{1t} = \hat{C}_{2,t+1} - \hat{C}_{2t} \quad (3.107)$$

9. Production Function

$$\hat{Y}_{\eta t} = \hat{Z}_{A\eta t} + \hat{L}_{\eta t} \quad (3.112)$$

10. Marginal Cost

$$\hat{P}_{\eta t} + \hat{\lambda}_{\eta t} = \hat{W}_{\eta t} - \hat{Z}_{A\eta t} \quad (3.113)$$

11. Monetary Policy

$$\hat{R}_t = \gamma_R \hat{R}_{t-1} + (1 - \gamma_R)(\gamma_\pi \hat{\pi}_t + \gamma_Y \hat{Y}_t) + \hat{Z}_{Mt} \quad (3.114)$$

12. National Gross Inflation Rate

$$\hat{\pi}_t = \theta_\pi \hat{\pi}_{1t} + (1 - \theta_\pi) \hat{\pi}_{2t} \quad (3.115)$$

13. Productivity Shock

$$\hat{Z}_{A\eta t} = \rho_{A\eta} \hat{Z}_{A\eta,t-1} + \varepsilon_{A\eta} \quad (3.116)$$

14. Monetary Shock

$$\hat{Z}_{Mt} = \rho_M \hat{Z}_{Mt-1} + \varepsilon_M \quad (3.117)$$

15. Market Clearing Condition

$$\hat{Y}_t = \theta_Y \hat{Y}_{1t} + (1 - \theta_Y) \hat{Y}_{2t} \quad (3.120)$$

16. Regional Market Clearing Condition

$$\hat{P}_{\eta t} + \hat{Y}_{\eta t} = \hat{Q}_{1t} + \hat{C}_{\eta t} \quad (3.121)$$

### 3.3.2 Extended Log-linear Structure

- Regional Gross Inflation Rate

$$\hat{\pi}_{1t} = \hat{P}_{1t} - \hat{P}_{1,t-1} \quad (3.88a)$$

$$\hat{\pi}_{2t} = \hat{P}_{2t} - \hat{P}_{2,t-1} \quad (3.88b)$$

- New Keynesian Phillips Curve

$$\hat{\pi}_{1t} = \beta \mathbb{E}_t \hat{\pi}_{1,t+1} + \frac{(1-\theta)(1-\theta\beta)}{\theta} \hat{\lambda}_{1t} \quad (3.100a)$$

$$\hat{\pi}_{2t} = \beta \mathbb{E}_t \hat{\pi}_{2,t+1} + \frac{(1-\theta)(1-\theta\beta)}{\theta} \hat{\lambda}_{2t} \quad (3.100b)$$

- Regional Consumption Weight

$$\hat{C}_{12t} - \hat{C}_{11t} = \hat{P}_{1t} - \hat{P}_{2t} \quad (3.101a)$$

$$\hat{C}_{22t} - \hat{C}_{21t} = \hat{P}_{1t} - \hat{P}_{2t} \quad (3.101b)$$

- Regional Consumption of Good 1

$$\hat{C}_{1t} - \hat{C}_{11t} = (1 - \omega_{11})(\hat{P}_{1t} - \hat{P}_{2t}) \quad (3.102a)$$

$$\hat{C}_{2t} - \hat{C}_{21t} = (1 - \omega_{21})(\hat{P}_{1t} - \hat{P}_{2t}) \quad (3.102b)$$

- Region 1 Price Index

$$\hat{Q}_{1t} = \omega_{11}\hat{P}_{1t} + (1 - \omega_{11})\hat{P}_{2t} \quad (3.103)$$

- Labor Supply

$$\varphi \hat{L}_{1t} + \sigma \hat{C}_{1t} = \hat{W}_{1t} - \hat{Q}_{1t} \quad (3.105a)$$

$$\varphi \hat{L}_{2t} + \sigma \hat{C}_{2t} = \hat{W}_{2t} - \hat{Q}_{1t} \quad (3.105b)$$

- Region 1 Euler equation for the bonds return

$$\hat{Q}_{1,t+1} - \hat{Q}_{1t} + \sigma(\hat{C}_{1,t+1} - \hat{C}_{1t}) = (1 - \beta)\hat{R}_t \quad (3.106)$$

- Euler equation for regional consumption

$$\hat{C}_{1,t+1} - \hat{C}_{1t} = \hat{C}_{2,t+1} - \hat{C}_{2t} \quad (3.107)$$

- Production Function

$$\hat{Y}_{1t} = \hat{Z}_{A1t} + \hat{L}_{1t} \quad (3.112a)$$

$$\hat{Y}_{2t} = \hat{Z}_{A2t} + \hat{L}_{2t} \quad (3.112b)$$

- Marginal Cost

$$\hat{P}_{1t} + \hat{\lambda}_{1t} = \hat{W}_{1t} - \hat{Z}_{A1t} \quad (3.113a)$$

$$\hat{P}_{2t} + \hat{\lambda}_{2t} = \hat{W}_{2t} - \hat{Z}_{A2t} \quad (3.113b)$$

- Monetary Policy

$$\hat{R}_t = \gamma_R \hat{R}_{t-1} + (1 - \gamma_R)(\gamma_\pi \hat{\pi}_t + \gamma_Y \hat{Y}_t) + \hat{Z}_{Mt} \quad (3.114)$$

- National Gross Inflation Rate

$$\hat{\pi}_t = \theta_\pi \hat{\pi}_{1t} + (1 - \theta_\pi) \hat{\pi}_{2t} \quad (3.115)$$

- Productivity Shock

$$\hat{Z}_{A1t} = \rho_{A1} \hat{Z}_{A1,t-1} + \varepsilon_{A1} \quad (3.116a)$$

$$\hat{Z}_{A2t} = \rho_{A2} \hat{Z}_{A2,t-1} + \varepsilon_{A2} \quad (3.116b)$$

- Monetary Shock

$$\hat{Z}_{Mt} = \rho_M \hat{Z}_{M,t-1} + \varepsilon_M \quad (3.117)$$

- Market Clearing Condition

$$\hat{Y}_t = \theta_Y \hat{Y}_{1t} + (1 - \theta_Y) \hat{Y}_{2t} \quad (3.120)$$

- Regional Market Clearing Condition

$$\hat{P}_{1t} + \hat{Y}_{1t} = \hat{Q}_{1t} + \hat{C}_{1t} \quad (3.121a)$$

$$\hat{P}_{2t} + \hat{Y}_{2t} = \hat{Q}_{1t} + \hat{C}_{2t} \quad (3.121b)$$

### 3.3.3 Eigenvalues and Forward Looking Variables

As it stands, the model has more forward-looking variables than eigenvalues greater than one, indicating that the model is indeterminate. To transform the model into one with a single solution, the number of eigenvalues and forward-looking variables must be equal. To achieve this, Farmer et al. (2015) substitutes the excess forward-looking variables with an expectational variable at time  $t$ , along with a expectational shock  $\text{sunspot}_\eta$ , representing the deviation between the expected and real values. For the present model, the variables created are the expected regional gross inflation rates

$$\pi_{\eta t}^X:$$

$$\pi_{\eta t}^X = \mathbb{E}_t \pi_{\eta, t+1} \quad (3.126)$$

$$sunspot_\eta = \pi_{\eta t} - \pi_{\eta, t-1}^X \quad (3.127)$$

### **3.4 Data**

In this section, the data necessary to estimate the model parameters will be discussed using descriptive statistics. The intention is to demonstrate, through graphics and tables, a visual correspondence between the nominal interest rate and the gross domestic product of select Brazilian states, particularly those specialized in agriculture and industries. This emphasis aims to show that regional differences play an important role in how a region will react to monetary policy.

### 3.4.1 Parameter Calibration

Table 1: Parameter Calibration

Parameter	Definition	Calibration
$\beta$	intertemporal discount factor	0.985
$\gamma_R$	interest-rate smoothing parameter	0.79
$\gamma_\pi$	interest-rate sensitivity in relation to inflation	2.43
$\gamma_Y$	interest-rate sensitivity in relation to product	0.16
$\theta$	price stickiness parameter	0.8
$\theta_Y$	weight of region 1 in total production	0.3
$\theta_\pi$	weight of region 1 inflation in total inflation	0.5
$\theta_Z$	productivity proportion between regions	0.7
$\theta_P$	price proportion between regions	0.9
$\rho_{A1}$	autoregressive parameter of productivity in region 1	0.95
$\rho_{A2}$	autoregressive parameter of productivity in region 2	0.95
$\rho_M$	autoregressive parameter of monetary policy	0.9
$\sigma$	relative risk aversion coefficient	2
$\phi$	relative labor weight in utility	1
$\varphi$	marginal disutility of labor supply	1.5
$\psi$	elasticity of substitution between intermediate goods	8
$\omega_{11}$	weight of good 1 in consumption composition of region 1	0.5
$\omega_{21}$	weight of good 1 in consumption composition of region 2	0.5

### 3.4.2 Variables at Steady State

Table 2: Variables at Steady State

Variable	Steady State Value
$\langle P \ P_1 \ P_2 \ Z_{A1} \ Z_{A2} \ Z_M \ \pi \ \pi_1 \ \pi_2 \rangle$	$\vec{1}$
$\langle \varepsilon_{A1} \ \varepsilon_{A2} \ \varepsilon_M \rangle$	$\vec{0}$
$R$	0.0402
$R_K$	0.0402
$\Lambda$	0.8750
$W$	1.6967
$\langle a_1 \ a_2 \rangle$	$\langle a_1 \ a_2 \rangle$
$\langle b_1 \ b_2 \rangle$	$\langle b_1 \ b_2 \rangle$
$\langle Y_1 \ Y_2 \rangle$	$\langle Y_1 \ Y_2 \rangle$
$\langle I_1 \ I_2 \rangle$	$\langle I_1 \ I_2 \rangle$
$\langle C_1 \ C_2 \rangle$	$\langle C_1 \ C_2 \rangle$
$\langle \mathcal{E}_1 \ \mathcal{E}_2 \rangle$	$\langle \mathcal{E}_1 \ \mathcal{E}_2 \rangle$
$\langle C_{11} \ C_{12} \rangle$	$\langle C_{11} \ C_{12} \rangle$
$\langle C_{21} \ C_{22} \rangle$	$\langle C_{21} \ C_{22} \rangle$
$\langle K_1 \ K_2 \rangle$	$\langle K_1 \ K_2 \rangle$
$\langle L_1 \ L_2 \rangle$	$\langle L_1 \ L_2 \rangle$

Source: The Author.

## **4 Results**

Following the data, a Bayesian estimation will be performed to estimate the model parameters.

In due time, a thorough analysis of the results will be conducted.

## 4.1 Impulse Response Functions

### 4.1.1 Productivity Shock

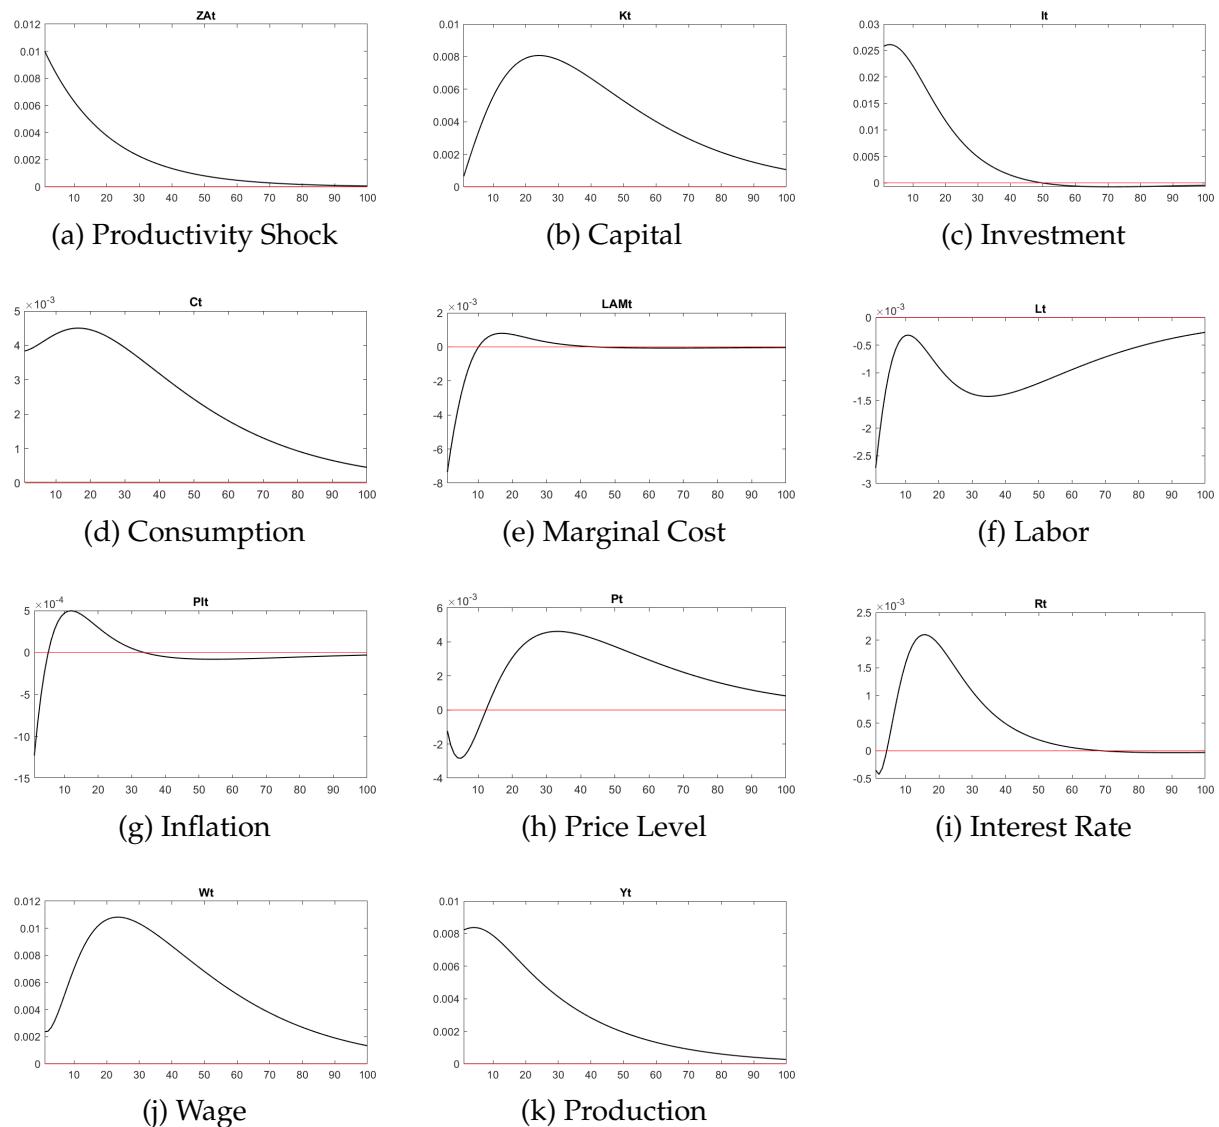

Figure 2: Productivity Shock Impulse Response Functions

### 4.1.2 Monetary Shock

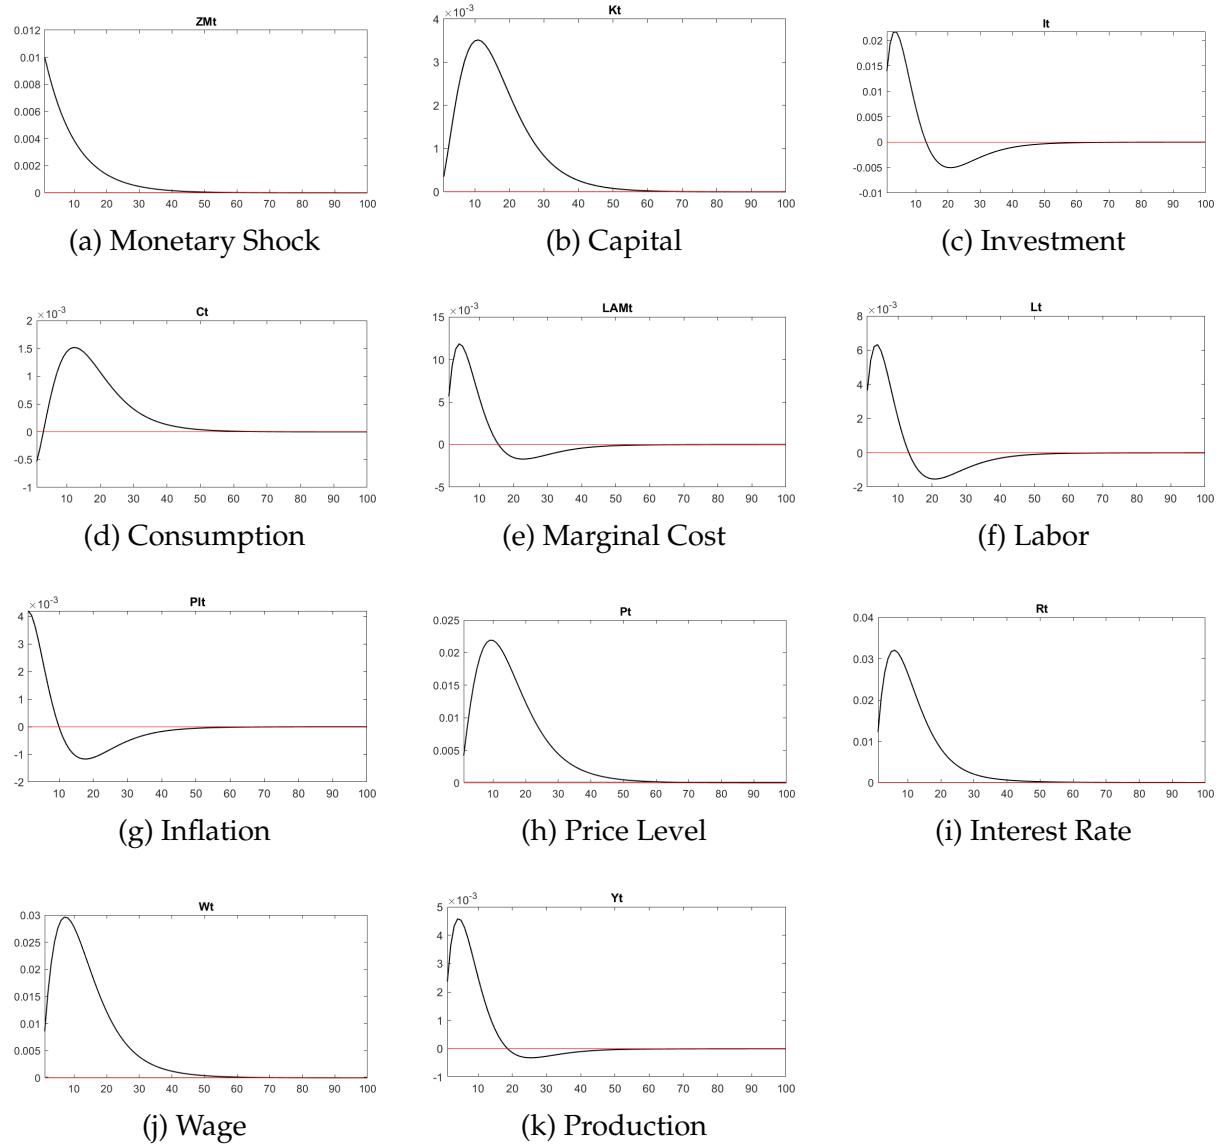

Figure 3: Monetary Shock Impulse Response Functions

## 4.2 Parametrization

To be done.

## **5 Final Remarks**

This section will summarize and discuss the main findings, implications, and potential future work related to your research.

## A Appendix

## A.1 Table of the Literature Review

A table of the literature review will be presented here, in order to compare the elements of each DSGE model discussed in the text.

## A.2 Definitions and Lemmas

The objective of this appendix is to present the definitions and lemmas used throughout the text.

### Household

**Definition A.1** (Discount Factor  $\beta$ ). Other things the same, a unit of consumption enjoyed tomorrow is less valuable (yields less utility) than a unit of consumption enjoyed today ([SOLIS-GARCIA, 2022](#), Lecture 2, p.1).

**Definition A.2** (Inada Condition). The Inada conditions ([INADA, 1963](#)) avoid corner solutions. For this purpose, it is assumed that the partial derivatives  $u_C$  and  $u_L$  of the function  $u(C, L)$  satisfy the following rules:

$$\begin{aligned} \lim_{C \rightarrow 0} u_C(C, L^*) &= \infty \quad \text{and} \quad \lim_{C \rightarrow \infty} u_C(C, L^*) = 0 \\ \lim_{L \rightarrow 0} u_C(C^*, L) &= \infty \quad \text{and} \quad \lim_{L \rightarrow \infty} u_C(C^*, L) = 0 \end{aligned} \tag{A.1}$$

where  $C^*, L^* \in \mathbb{R}_{++}$  and  $u_j$  is the partial derivative of the utility function with respect to  $j = C, L$  ([SOLIS-GARCIA, 2022](#), Lecture 1, p.2)

**Definition A.3** (Transversality Condition). ([SOLIS-GARCIA, 2022](#), Lecture 4, p.4)

### Firms

**Lemma A.1** (Marginal Cost). *The Lagrangian multiplier  $\Lambda_t$  is the nominal marginal cost of the intermediate-good firm:*

$$MC_t := \frac{\partial TC_t}{\partial Y_t} = \Lambda_t \tag{A.2}$$

*Proof.* [Simon and Blume \(1994](#), p.449). ■

**Definition A.4** (Constant Returns to Scale). ([SOLIS-GARCIA, 2022](#), Lecture 1, p.5)

**Definition A.5** (Homogeneous Function of Degree  $k$ ). ([SOLIS-GARCIA, 2022](#), Lecture 1, p.5)

## Monetary Authority

### Shocks

### Equilibrium Conditions

**Definition A.6** (Competitive Equilibrium). ([SOLIS-GARCIA, 2022](#), Lecture 1, p.6)

### Steady State

**Lemma A.2** (Steady State Inflation). *In steady state, prices are stable  $P_t = P_{t-1} = P$  and the gross inflation rate is one.*

*Proof.* Equation [B.53](#). ■

**Corollary A.2.1.** *In steady state, all firms have the same level of production  $Y$  and therefore demand the same amount of factors, capital  $K$  and labor  $L$ .*

$$P_t = P_{t-1} = P \implies \begin{pmatrix} Y_j & K_j & L_j \end{pmatrix} = \begin{pmatrix} Y & K & L \end{pmatrix}$$

### Log-linearization

**Definition A.7** (PERCENTAGE DEVIATION). The percentage deviation of a variable  $x_t$  from its steady state is given by ([SOLIS-GARCIA, 2022](#), Lecture 6, p.2):

$$\hat{x}_t := \frac{x_t - x}{x} \tag{A.3}$$

**Lemma A.3** (UHLIG'S RULES). *The Uhlig's rules are a set of approximations used to log-linearize equations ([SOLIS-GARCIA, 2022](#), Lecture 6, p.2).*

- Rule 1:

$$x_t = x(1 + \hat{x}_t)$$

- Rule 2 (Product):

- Rule 3 (Exponential):

**Corollary A.3.1** (Logarithm Rule).

$$\ln x_t \approx \ln x + \hat{x}_t$$

**Definition A.8 (LEVEL DEVIATION).** The level deviation of a variable  $u_t$  from its steady state is given by: ([SOLIS-GARCIA, 2022](#), Lecture 9, p.9)

$$\tilde{u}_t := u_t - u \quad (\text{A.4})$$

**Lemma A.4 (UHLIG'S RULES FOR LEVEL DEVIATIONS).** Uhlig's rules can be applied to level deviations in order to log-linearize equations ([SOLIS-GARCIA, 2022](#), Lecture 9, p.9).

- Rule 1:

$$u_t = u + \tilde{u}_t \quad (\text{A.5})$$

$$u_t = u \left( 1 + \frac{\tilde{u}_t}{u} \right) \quad (\text{A.6})$$

- Rule 2 (Product):
- Rule 3 (Exponential):
- Rule 4 (Logarithm):
- Rule 5 (Percentage and Level Deviations)

**Lemma A.5 (LEVEL DEVIATION OF THE PRESENT VALUE DISCOUNT FACTOR).** The level deviation of the present value discount factor is equivalent to ([SOLIS-GARCIA, 2022](#), Lecture 13, p.6):

$$\prod_{k=0}^{s-1} (1 + R_{t+k}) = (1 + R)^s \left( 1 + \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \quad (\text{A.7})$$

*Proof.* Substitute the interest rate by the gross interest rate  $GR_t = 1 + R_t$  and apply rule [A.6](#):

$$\begin{aligned} \prod_{k=0}^{s-1} (1 + R_{t+k}) &= \prod_{k=0}^{s-1} (GR_{t+k}) && \implies \\ GR \times \cdots \times GR \left( 1 + \frac{1}{GR} \widetilde{GR}_t + \frac{1}{GR} \widetilde{GR}_{t+1} + \cdots + \frac{1}{GR} \widetilde{GR}_{t+s-1} \right) && \implies \\ GR^s \left( 1 + \frac{1}{GR} \sum_{k=0}^{s-1} \widetilde{GR}_{t+k} \right) && \implies \\ (1 + R)^s \left( 1 + \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) && \end{aligned}$$

■

**Definition A.9** (Geometric Series). A geometric series is the sum of the terms of a geometric sequence.

$$S_\infty = \sum_{i=0}^{\infty} ar^i \implies S_\infty = \frac{a}{1-r}, |r| < 1$$

**Definition A.10** (LAG AND LEAD OPERATORS). The lag operator  $\mathbb{L}$  is a mathematical operator that represents the backshift or lag of a time series ([SOLIS-GARCIA, 2022](#), Lecture 13, p.9):

$$\begin{aligned}\mathbb{L}x_t &= x_{t-1} \\ (1 + a\mathbb{L})y_{t+2} &= y_{t+2} + ay_{t+1}\end{aligned}$$

Analogously, the lead operator  $\mathbb{L}^{-1}$  (or inverse lag operator) yields a variable's lead ([SOLIS-GARCIA, 2022](#), Lecture 13, p.9):

$$\begin{aligned}\mathbb{L}^{-1}x_t &= x_{t+1} \\ (1 + a\mathbb{L}^{-1})y_{t+2} &= y_{t+2} + ay_{t+3}\end{aligned}$$

## Canonical NK Model

**Definition A.11** (Medium Scale DSGE Model). A Medium Scale DSGE Model has habit formation, capital accumulation, indexation, etc. ([GALÍ, 2015](#), p.208).

See Galí, Smets, and Wouters (2012) for an analysis of the sources of unemployment fluctuations in an estimated medium-scale version of the present model.

**Definition A.12** (Stochastic Process). ([SOLIS-GARCIA, 2022](#), Lecture 5, p.3).

**Definition A.13** (Markov Process). ([SOLIS-GARCIA, 2022](#), Lecture 5, p.4).

**Definition A.14** (first-order autoregressive process  $AR(1)$ ). the first-order autoregressive process  $AR(1)$  ([SOLIS-GARCIA, 2022](#), Lecture 5, p.4).

**Definition A.15** (Blanchard-Kahn Conditions). ([SOLIS-GARCIA, 2022](#), Hands on 5, p.14).

## B.1 Household

### Utility Maximization Problem

Following the models presented by Costa Junior (2016) and Solis-Garcia (2022), the representative household problem is to maximize an intertemporal utility function  $U$  with respect to consumption  $C_t$  and labor  $L_t$ , subject to a budget constraint, a capital accumulation rule and the non-negativity of real variables:

$$\max_{C_t, L_t, K_{t+1}} : U(C_t, L_t) = \mathbb{E}_t \sum_{t=0}^{\infty} \beta^t \left( \frac{C_t^{1-\sigma}}{1-\sigma} - \phi \frac{L_t^{1+\varphi}}{1+\varphi} \right) \quad (\text{B.1})$$

$$\text{s. t. : } P_t(C_t + I_t) = W_t L_t + R_t K_t + \Pi_t \quad (\text{B.2})$$

$$K_{t+1} = (1 - \delta)K_t + I_t \quad (\text{B.3})$$

$$C_t, L_t, K_{t+1} \geq 0 ; K_0 \text{ given.}$$

where  $\mathbb{E}_t$  is the expectation operator,  $\beta$  is the intertemporal discount factor,  $\sigma$  is the relative risk aversion coefficient,  $\phi$  is the labor relative weight in utility,  $\varphi$  is the marginal disutility of labor supply. In the budget constraint,  $P_t$  is the price level,  $I_t$  is the investment,  $W_t$  is the wage level,  $K_t$  is the capital stock,  $R_t$  is the return on capital, and  $\Pi_t$  is the firm profit. In the capital accumulation rule,  $\delta$  is the capital depreciation rate.

Isolate  $I_t$  in B.3 and substitute in B.2:

$$K_{t+1} = (1 - \delta)K_t + I_t \implies I_t = K_{t+1} - (1 - \delta)K_t \quad (\text{B.3})$$

$$P_t(C_t + I_t) = W_t L_t + R_t K_t + \Pi_t \implies \quad (\text{B.2})$$

$$P_t(C_t + K_{t+1} - (1 - \delta)K_t) = W_t L_t + R_t K_t + \Pi_t \quad (\text{B.4})$$

### Lagrangian

The maximization problem with restriction can be transformed in one without restriction using the Lagrangian function  $\mathcal{L}$  with B.1 and B.4:

$$\begin{aligned} \mathcal{L} = \mathbb{E}_t \sum_{t=0}^{\infty} \beta^t & \left\{ \left( \frac{C_t^{1-\sigma}}{1-\sigma} - \phi \frac{L_t^{1+\varphi}}{1+\varphi} \right) - \right. \\ & \left. - \mu_t \left[ P_t(C_t + K_{t+1} - (1 - \delta)K_t) - (W_t L_t + R_t K_t + \Pi_t) \right] \right\} \quad (\text{B.5}) \end{aligned}$$

## First Order Conditions

The first order conditions with respect to  $C_t$ ,  $L_t$ ,  $K_{t+1}$  and  $\mu_t$  are:

$$C_t : C_t^{-\sigma} - \mu_t P_t = 0 \implies \mu_t = \frac{C_t^{-\sigma}}{P_t} \quad (\text{B.6})$$

$$L_t : -\phi L_t^\varphi + \mu_t W_t = 0 \implies \mu_t = \frac{\phi L_t^\varphi}{W_t} \quad (\text{B.7})$$

$$K_{t+1} : -\mu_t P_t + \beta \mathbb{E}_t \mu_{t+1} [(1-\delta)P_{t+1} + R_{t+1}] = 0 \implies \mu_t P_t = \beta \mathbb{E}_t \mu_{t+1} [(1-\delta)P_{t+1} + R_{t+1}] \quad (\text{B.8})$$

$$\mu_t : P_t (C_t + K_{t+1} - (1-\delta)K_t) = W_t L_t + R_t K_t + \Pi_t \quad (\text{B.4})$$

## Solutions

Match equations B.6 and B.7:

$$\frac{C_t^{-\sigma}}{P_t} = \frac{\phi L_t^\varphi}{W_t} \implies \frac{\phi L_t^\varphi}{C_t^{-\sigma}} = \frac{W_t}{P_t} \quad (\text{B.9})$$

Equation B.9 is the Household Labor Supply and shows that the marginal rate of substitution (MRS) of labor for consumption is equal to the real wage, which is the relative price between labor and goods.

Substitute  $\mu_t$  and  $\mu_{t+1}$  from equation B.6 in B.8:

$$\begin{aligned} \mu_t P_t &= \beta \mathbb{E}_t \mu_{t+1} [(1-\delta)P_{t+1} + R_{t+1}] \implies \\ \frac{C_t^{-\sigma}}{P_t} P_t &= \beta \mathbb{E}_t \frac{C_{t+1}^{-\sigma}}{P_{t+1}} [(1-\delta)P_{t+1} + R_{t+1}] \implies \\ \left( \frac{\mathbb{E}_t C_{t+1}}{C_t} \right)^\sigma &= \beta \left[ (1-\delta) + \mathbb{E}_t \left( \frac{R_{t+1}}{P_{t+1}} \right) \right] \end{aligned} \quad (\text{B.10})$$

Equation B.10 is the Household Euler equation.

## B.2 Firms

Consider two types of firms: (1) a continuum of intermediate-good firms, which operate in monopolistic competition and each produce one variety with imperfect sub-

stitution level between each other and (2) the final-good firm, which aggregates all the varieties into a final bundle and operates in perfect competition.

### B.2.1 Final-Good Firm

#### Profit Maximization Problem

The role of the final-good firm is to aggregate all the varieties produced by the intermediate-good firms, so that the representative consumer can buy only one good  $Y_t$ , the bundle good. The final-good firm problem is to maximize its profit, considering that its output is the bundle  $Y_t$  formed by the continuum of intermediate goods  $Y_{jt}$ , where  $j \in [0, 1]$  and  $\psi$  is the elasticity of substitution between intermediate goods:

$$\max_{Y_{jt}} : \Pi_t = P_t Y_t - \int_0^1 P_{jt} Y_{jt} \, dj \quad (\text{B.11})$$

$$\text{s. t. : } Y_t = \left( \int_0^1 Y_{jt}^{\frac{\psi-1}{\psi}} \, dj \right)^{\frac{\psi}{\psi-1}} \quad (\text{B.12})$$

Substitute B.12 in B.11:

$$\max_{Y_{jt}} : \Pi_t = P_t \left( \int_0^1 Y_{jt}^{\frac{\psi-1}{\psi}} \, dj \right)^{\frac{\psi}{\psi-1}} - \int_0^1 P_{jt} Y_{jt} \, dj \quad (\text{B.13})$$

#### First Order Condition and Solutions

The first order condition is:

$$Y_{jt} : P_t \left( \frac{\psi}{\psi-1} \right) \left( \int_0^1 Y_{jt}^{\frac{\psi-1}{\psi}} \, dj \right)^{\frac{\psi}{\psi-1}-1} \left( \frac{\psi-1}{\psi} \right) Y_{jt}^{\frac{\psi-1}{\psi}-1} - P_{jt} = 0 \implies Y_{jt} = Y_t \left( \frac{P_t}{P_{jt}} \right)^{\psi} \quad (\text{B.14})$$

Equation B.14 shows that the demand for variety  $j$  depends on its relative price.

Substitute B.14 in B.12:

$$\begin{aligned}
 Y_t &= \left( \int_0^1 Y_{jt}^{\frac{\psi-1}{\psi}} dj \right)^{\frac{\psi}{\psi-1}} \implies \\
 Y_t &= \left( \int_0^1 \left[ Y_t \left( \frac{P_t}{P_{jt}} \right)^\psi \right]^{\frac{\psi-1}{\psi}} dj \right)^{\frac{\psi}{\psi-1}} \implies \\
 P_t &= \left[ \int_0^1 P_{jt}^{1-\psi} dj \right]^{\frac{1}{1-\psi}}
 \end{aligned} \tag{B.15}$$

Equation B.15 is the final-good firm's markup.

## B.2.2 Intermediate-Good Firms

### Cost Minimization Problem

There is an intermediate-good continuum, where each firm, denoted by  $j \in [0, 1]$ , produces varieties of a representative good with a specific level of substitutability. Each of these firms must choose capital  $K_{jt}$  and labor  $L_{jt}$  to minimize production costs, subject to a technology rule:

$$\min_{K_{jt}, L_{jt}} : R_t K_{jt} + W_t L_{jt} \tag{B.16}$$

$$\text{s. t. : } Y_{jt} = Z_{At} K_{jt}^\alpha L_{jt}^{1-\alpha} \tag{B.17}$$

where  $Y_{jt}$  is the output obtained by the production technology level  $Z_{At}$ <sup>11</sup> that transforms capital  $K_{jt}$  and labor  $L_{jt}$  in proportions  $\alpha$  and  $(1 - \alpha)$ , respectively, into intermediate goods.

<sup>11</sup> the production technology level  $Z_{At}$  will be submitted to a productivity shock, detailed in section B.3.1.

## Lagrangian

Applying the Lagrangian:

$$\mathcal{L} = (R_t K_{jt} + W_t L_{jt}) - \Lambda_t (Z_{At} K_{jt}^\alpha L_{jt}^{1-\alpha} - Y_{jt}) \quad (\text{B.18})$$

where the Lagrangian multiplier  $\Lambda_t$  is the marginal cost<sup>12</sup>.

## First Order Conditions

The first-order conditions are:

$$K_{jt} : R_t - \Lambda_t Z_{At} \alpha K_{jt}^{\alpha-1} L_{jt}^{1-\alpha} = 0 \implies K_{jt} = \alpha Y_{jt} \frac{\Lambda_t}{R_t} \quad (\text{B.19})$$

$$L_{jt} : W_t - \Lambda_t Z_{At} K_{jt}^\alpha (1-\alpha) L_{jt}^{-\alpha} = 0 \implies L_{jt} = (1-\alpha) Y_{jt} \frac{\Lambda_t}{W_t} \quad (\text{B.20})$$

$$\Lambda_t : Y_{jt} = Z_{At} K_{jt}^\alpha L_{jt}^{1-\alpha} \quad (\text{B.17})$$

## Solutions

Divide equation B.19 by B.20:

$$\frac{K_{jt}}{L_{jt}} = \frac{\alpha Y_{jt} \Lambda_t / R_t}{(1-\alpha) Y_{jt} \Lambda_t / W_t} \implies \frac{K_{jt}}{L_{jt}} = \left( \frac{\alpha}{1-\alpha} \right) \frac{W_t}{R_t} \quad (\text{B.21})$$

Equation B.21 demonstrates the relationship between the technical marginal rate of substitution (TMRS) and the economical marginal rate of substitution (EMRS).

Substitute  $L_{jt}$  from equation B.21 in B.17:

$$\begin{aligned} Y_{jt} &= Z_{At} K_{jt}^\alpha L_{jt}^{1-\alpha} \implies \\ Y_{jt} &= Z_{At} K_{jt}^\alpha \left[ \left( \frac{1-\alpha}{\alpha} \right) \frac{R_t K_{jt}}{W_t} \right]^{1-\alpha} \implies \\ K_{jt} &= \frac{Y_{jt}}{Z_{At}} \left[ \left( \frac{\alpha}{1-\alpha} \right) \frac{W_t}{R_t} \right]^{1-\alpha} \end{aligned} \quad (\text{B.22})$$

<sup>12</sup> see Lemma A.1

Equation B.22 is the intermediate-good firm demand for capital.

Substitute B.22 in B.21:

$$\begin{aligned} L_{jt} &= \left( \frac{1-\alpha}{\alpha} \right) \frac{R_t K_{jt}}{W_t} \implies \\ L_{jt} &= \left( \frac{1-\alpha}{\alpha} \right) \frac{R_t}{W_t} \frac{Y_{jt}}{Z_{At}} \left[ \left( \frac{\alpha}{1-\alpha} \right) \frac{W_t}{R_t} \right]^{1-\alpha} \implies \\ L_{jt} &= \frac{Y_{jt}}{Z_{At}} \left[ \left( \frac{\alpha}{1-\alpha} \right) \frac{W_t}{R_t} \right]^{-\alpha} \end{aligned} \quad (\text{B.23})$$

Equation B.23 is the intermediate-good firm demand for labor.

### Total and Marginal Costs

Calculate the total cost using B.22 and B.23:

$$\begin{aligned} TC_{jt} &= W_t L_{jt} + R_t K_{jt} \implies \\ TC_{jt} &= W_t \frac{Y_{jt}}{Z_{At}} \left[ \left( \frac{\alpha}{1-\alpha} \right) \frac{W_t}{R_t} \right]^{-\alpha} + R_t \frac{Y_{jt}}{Z_{At}} \left[ \left( \frac{\alpha}{1-\alpha} \right) \frac{W_t}{R_t} \right]^{1-\alpha} \implies \\ TC_{jt} &= \frac{Y_{jt}}{Z_{At}} \left( \frac{R_t}{\alpha} \right)^\alpha \left( \frac{W_t}{1-\alpha} \right)^{1-\alpha} \end{aligned} \quad (\text{B.24})$$

Calculate the marginal cost using B.24:

$$\Lambda_{jt} = \frac{\partial TC_{jt}}{\partial Y_{jt}} \implies \Lambda_{jt} = \frac{1}{Z_{At}} \left( \frac{R_t}{\alpha} \right)^\alpha \left( \frac{W_t}{1-\alpha} \right)^{1-\alpha} \quad (\text{B.25})$$

The marginal cost depends on the technological level  $Z_{At}$ , the nominal interest rate  $R_t$  and the nominal wage level  $W_t$ , which are the same for all intermediate-good firms, and because of that, the index  $j$  may be dropped:

$$\Lambda_t = \frac{1}{Z_{At}} \left( \frac{R_t}{\alpha} \right)^\alpha \left( \frac{W_t}{1-\alpha} \right)^{1-\alpha} \quad (\text{B.26})$$

notice that:

$$\Lambda_t = \frac{TC_{jt}}{Y_{jt}} \implies TC_{jt} = \Lambda_t Y_{jt} \quad (\text{B.27})$$

## Optimal Price Problem

Consider an economy with price stickiness, following the Calvo Rule ([CALVO, 1983](#)): each firm has a probability ( $0 < \theta < 1$ ) of keeping its price in the next period ( $P_{j,t+1} = P_{j,t}$ ), and a probability of ( $1 - \theta$ ) of setting a new optimal price  $P_{j,t}^*$  that maximizes its profits. Therefore, each firm must take this uncertainty into account when deciding the optimal price: the intertemporal profit flow, given the nominal interest rate  $R_t$  of each period, is calculated considering the probability  $\theta$  of keeping the previous price.

$$\max_{P_{jt}} : \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s [P_{jt} Y_{j,t+s} - TC_{j,t+s}]}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \quad (\text{B.28})$$

$$\text{s. t. : } Y_{jt} = Y_t \left( \frac{P_t}{P_{jt}} \right)^\psi \quad (\text{B.14})$$

Substitute [B.27](#) in [B.28](#):

$$\max_{P_{jt}} : \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s [P_{jt} Y_{j,t+s} - \Lambda_{t+s} Y_{j,t+s}]}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \quad (\text{B.29})$$

Substitute [B.14](#) in [B.29](#) and rearrange the variables:

$$\begin{aligned} \max_{P_{jt}} : \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s \left[ P_{jt} Y_{t+s} \left( \frac{P_{t+s}}{P_{jt}} \right)^\psi - \Lambda_{t+s} Y_{t+s} \left( \frac{P_{t+s}}{P_{jt}} \right)^\psi \right]}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} &\Rightarrow \\ \max_{P_{jt}} : \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s \left[ P_{jt}^{1-\psi} P_{t+s}^\psi Y_{t+s} - P_{jt}^{-\psi} P_{t+s}^\psi Y_{t+s} \Lambda_{t+s} \right]}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} & \end{aligned}$$

## First Order Condition

The first order condition with respect to  $P_{jt}$  is:

$$\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s \left[ (1 - \psi) P_{jt}^{-\psi} P_{t+s}^\psi Y_{t+s} - (-\psi) P_{jt}^{-\psi-1} P_{t+s}^\psi Y_{t+s} \Lambda_{t+s} \right]}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} = 0$$

Separate the summations and rearrange the variables:

$$\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s (\psi - 1) \left( \frac{P_{t+s}}{P_{jt}} \right)^{\psi} Y_{t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} = \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s \psi P_{jt}^{-1} \left( \frac{P_{t+s}}{P_{jt}} \right)^{\psi} Y_{t+s} \Lambda_{t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \quad (\text{B.30})$$

Substitute B.14 in B.30:

$$\begin{aligned} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s (\psi - 1) Y_{j,t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} &= \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s \psi P_{jt}^{-1} Y_{j,t+s} \Lambda_{t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \implies \\ (\psi - 1) \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s Y_{j,t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} &= \psi P_{jt}^{-1} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s Y_{j,t+s} \Lambda_{t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \implies \\ P_{jt} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s Y_{j,t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} &= \frac{\psi}{\psi - 1} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s Y_{j,t+s} \Lambda_{t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \implies \\ P_{jt}^* &= \frac{\psi}{\psi - 1} \cdot \frac{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{j,t+s} \Lambda_{t+s} / \prod_{k=0}^{s-1} (1 + R_{t+k}) \right\}}{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{j,t+s} / \prod_{k=0}^{s-1} (1 + R_{t+k}) \right\}} \end{aligned} \quad (\text{B.31})$$

Equation B.31 represents the optimal price that firm  $j$  will choose. Since all firms that are able to choose will opt for the highest possible price, they will all select the same price. As a result, the index  $j$  can be omitted:

$$P_t^* = \frac{\psi}{\psi - 1} \cdot \frac{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{j,t+s} \Lambda_{t+s} / \prod_{k=0}^{s-1} (1 + R_{t+k}) \right\}}{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{j,t+s} / \prod_{k=0}^{s-1} (1 + R_{t+k}) \right\}} \quad (\text{B.32})$$

### B.2.3 Final-Good Firm, part II

The process of fixing prices is random: in each period,  $\theta$  firms will maintain the price from the previous period, while  $(1 - \theta)$  firms will choose a new optimal price. The price level for each period will be a composition of these two prices. Use this information in B.15 to determine the aggregate price level:

$$\begin{aligned} P_t &= \left[ \int_0^\theta P_{t-1}^{1-\psi} dj + \int_\theta^1 P_t^{*1-\psi} dj \right]^{\frac{1}{1-\psi}} \implies \\ P_t &= \left[ \theta P_{t-1}^{1-\psi} + (1 - \theta) P_t^{*1-\psi} \right]^{\frac{1}{1-\psi}} \end{aligned} \quad (\text{B.33})$$

Equation B.33 is the aggregate price level.

## B.3 Monetary Authority

The objective of the monetary authority is to conduct the economy to price stability and economic growth, using a Taylor rule (TAYLOR, 1993) to determine the nominal interest rate:

$$\frac{R_t}{R} = \left( \frac{R_{t-1}}{R} \right)^{\gamma_R} \left[ \left( \frac{\pi_t}{\pi} \right)^{\gamma_\pi} \left( \frac{Y_t}{Y} \right)^{\gamma_Y} \right]^{1-\gamma_R} Z_{Mt} \quad (\text{B.34})$$

where  $\pi_t$  is the gross inflation rate, defined by:

$$\pi_t = \frac{P_t}{P_{t-1}} \quad (\text{B.35})$$

and  $R, \pi, Y$  are the variables in steady state,  $\gamma_R$  is the smoothing parameter for the interest rate  $R_t$ , while  $\gamma_\pi$  and  $\gamma_Y$  are the interest-rate sensitivities in relation to inflation and product, respectively and  $Z_{Mt}$  is the monetary shock<sup>13</sup>.

### B.3.1 Stochastic Shocks

#### Productivity Shock

The production technology level  $Z_{At}$  will be submitted to a productivity shock defined by a first-order autoregressive process  $AR(1)$ :

$$\ln Z_{At} = (1 - \rho_A) \ln Z_A + \rho_A \ln Z_{A,t-1} + \varepsilon_{At} \quad (\text{B.36})$$

where  $\rho_A \in [0, 1]$  is the autoregressive parameter and  $\varepsilon_{At} \sim \mathcal{N}(0, \sigma_A)$ .

<sup>13</sup> for the monetary shock definition, see section B.3.1.

## Monetary Shock

The monetary policy will also be submitted to a shock, through the variable  $Z_{Mt}$ , defined by a first-order autoregressive process  $AR(1)$ :

$$\ln Z_{Mt} = (1 - \rho_M) \ln Z_M + \rho_M \ln Z_{M,t-1} + \varepsilon_{Mt} \quad (B.37)$$

where  $\rho_M \in [0, 1]$  and  $\varepsilon_{Mt} \sim \mathcal{N}(0, \sigma_M)$ .

## B.4 Equilibrium Conditions

A Competitive Equilibrium consists of sequences of prices  $\{P_t^*, R_t^*, W_t^*\}$ , allocations for households  $\mathcal{A}_H := \{C_t^*, L_t^*, K_{t+1}^*\}$  and for firms  $\mathcal{A}_F := \{K_{jt}^*, L_{jt}^*, Y_{jt}^*, Y_t^*\}$ . In such an equilibrium, given the set of exogenous variables  $\{K_0, Z_{At}, Z_{Mt}\}$ , the elements in  $\mathcal{A}_H$  solve the household problem, while the elements in  $\mathcal{A}_F$  solve the firms' problems, and the markets for goods and labor clear:

$$Y_t = C_t + I_t \quad (B.38)$$

$$L_t = \int_0^1 L_{jt} \, d j \quad (B.39)$$

### B.4.1 Model Structure

The model is composed of the preview solutions, forming a square system of 16 variables and 16 equations, summarized as follows:

- Variables (16):
  - from the household problem:  $C_t, L_t, K_{t+1}$ ;
  - from the final-good firm problem:  $Y_{jt}, P_t$ ;
  - from the intermediate-good firm problems:  $K_{jt}, L_{jt}, P_t^*$ ;
  - from the market clearing condition:  $Y_t, I_t$ ;
  - prices:  $W_t, R_t, \Lambda_t, \pi_t$ ;
  - shocks:  $Z_{At}, Z_{Mt}$ .
- Equations (16):

1. Labor Supply:

$$\frac{\phi L_t^\varphi}{C_t^{-\sigma}} = \frac{W_t}{P_t} \quad (\text{B.9})$$

2. Household Euler Equation:

$$\left( \frac{\mathbb{E}_t C_{t+1}}{C_t} \right)^\sigma = \beta \left[ (1 - \delta) + \mathbb{E}_t \left( \frac{R_{t+1}}{P_{t+1}} \right) \right] \quad (\text{B.10})$$

3. Budget Constraint:

$$P_t(C_t + I_t) = W_t L_t + R_t K_t + \Pi_t \quad (\text{B.2})$$

4. Law of Motion for Capital:

$$K_{t+1} = (1 - \delta)K_t + I_t \quad (\text{B.3})$$

5. Bundle Technology:

$$Y_t = \left( \int_0^1 Y_{jt}^{\frac{\psi-1}{\psi}} d j \right)^{\frac{\psi}{\psi-1}} \quad (\text{B.12})$$

6. General Price Level:

$$P_t = \left[ \theta P_{t-1}^{1-\psi} + (1 - \theta) P_t^{*1-\psi} \right]^{\frac{1}{1-\psi}} \quad (\text{B.33})$$

7. Capital Demand:

$$K_{jt} = \alpha Y_{jt} \frac{\Lambda_t}{R_t} \quad (\text{B.19})$$

8. Labor Demand:

$$L_{jt} = (1 - \alpha) Y_{jt} \frac{\Lambda_t}{W_t} \quad (\text{B.20})$$

9. Marginal Cost:

$$\Lambda_t = \frac{1}{Z_{At}} \left( \frac{R_t}{\alpha} \right)^\alpha \left( \frac{W_t}{1 - \alpha} \right)^{1-\alpha} \quad (\text{B.26})$$

10. Production Function:

$$Y_{jt} = Z_{At} K_{jt}^\alpha L_{jt}^{1-\alpha} \quad (\text{B.17})$$

11. Optimal Price:

$$P_t^* = \frac{\psi}{\psi - 1} \cdot \frac{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{j,t+s} \Lambda_{t+s} / \prod_{k=0}^{s-1} (1 + R_{t+k}) \right\}}{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{j,t+s} / \prod_{k=0}^{s-1} (1 + R_{t+k}) \right\}} \quad (\text{B.32})$$

12. Market Clearing Condition:

$$Y_t = C_t + I_t \quad (\text{B.38})$$

13. Monetary Policy:

$$\frac{R_t}{R} = \left( \frac{R_{t-1}}{R} \right)^{\gamma_R} \left[ \left( \frac{\pi_t}{\pi} \right)^{\gamma_\pi} \left( \frac{Y_t}{Y} \right)^{\gamma_Y} \right]^{1-\gamma_R} Z_{Mt} \quad (\text{B.34})$$

14. Gross Inflation Rate:

$$\pi_t = \frac{P_t}{P_{t-1}} \quad (\text{B.35})$$

15. Productivity Shock:

$$\ln Z_{At} = (1 - \rho_A) \ln Z_A + \rho_A \ln Z_{A,t-1} + \varepsilon_{At} \quad (\text{B.36})$$

16. Monetary Shock:

$$\ln Z_{Mt} = (1 - \rho_M) \ln Z_M + \rho_M \ln Z_{M,t-1} + \varepsilon_{Mt} \quad (\text{B.37})$$

## B.5 Steady State

The steady state is defined by the constancy of the variables through time. For any given endogenous variable  $X_t$ , it is in steady state if  $\mathbb{E}_t X_{t+1} = X_t = X_{t-1} = X_{ss}$  ([COSTA JUNIOR, 2016](#), p.41). For conciseness, the  $ss$  index representing the steady state will be omitted, so that  $X := X_{ss}$ . The steady state of each equation of the model is:

1. Labor Supply:

$$\frac{\phi L_t^\varphi}{C_t^{-\sigma}} = \frac{W_t}{P_t} \implies \frac{\phi L^\varphi}{C^{-\sigma}} = \frac{W}{P} \quad (\text{B.40})$$

2. Household Euler Equation:

$$\left( \frac{\mathbb{E}_t C_{t+1}}{C_t} \right)^\sigma = \beta \left[ (1 - \delta) + \mathbb{E}_t \left( \frac{R_{t+1}}{P_{t+1}} \right) \right] \implies 1 = \beta \left[ (1 - \delta) + \frac{R}{P} \right] \quad (\text{B.41})$$

3. Budget Constraint:

$$P_t(C_t + I_t) = W_t L_t + R_t K_t + \Pi_t \implies P(C + I) = WL + RK + \Pi \quad (\text{B.42})$$

4. Law of Motion for Capital:

$$K_{t+1} = (1 - \delta)K_t + I_t \implies K = (1 - \delta)K + I \implies I = \delta K \quad (\text{B.43})$$

5. Bundle Technology:

$$Y_t = \left( \int_0^1 Y_{jt}^{\frac{\psi-1}{\psi}} dj \right)^{\frac{\psi}{\psi-1}} \implies Y = \left( \int_0^1 Y_j^{\frac{\psi-1}{\psi}} dj \right)^{\frac{\psi}{\psi-1}} \quad (\text{B.44})$$

6. General Price Level:

$$\begin{aligned} P_t &= \left[ \theta P_{t-1}^{1-\psi} + (1 - \theta) P_t^{*1-\psi} \right]^{\frac{1}{1-\psi}} \implies \\ P^{1-\psi} &= \theta P^{1-\psi} + (1 - \theta) P^{*1-\psi} \implies \\ (1 - \theta) P^{1-\psi} &= (1 - \theta) P^{*1-\psi} \implies P = P^* \end{aligned} \quad (\text{B.45})$$

7. Capital Demand:

$$K_{jt} = \alpha Y_{jt} \frac{\Lambda_t}{R_t} \implies K_j = \alpha Y_j \frac{\Lambda}{R} \quad (\text{B.46})$$

8. Labor Demand:

$$L_{jt} = (1 - \alpha) Y_{jt} \frac{\Lambda_t}{W_t} \implies L_j = (1 - \alpha) Y_j \frac{\Lambda}{W} \quad (\text{B.47})$$

9. Marginal Cost:

$$\Lambda_t = \frac{1}{Z_{At}} \left( \frac{R_t}{\alpha} \right)^\alpha \left( \frac{W_t}{1 - \alpha} \right)^{1-\alpha} \implies \Lambda = \frac{1}{Z_A} \left( \frac{R}{\alpha} \right)^\alpha \left( \frac{W}{1 - \alpha} \right)^{1-\alpha} \quad (\text{B.48})$$

10. Production Technology:

$$Y_{jt} = Z_{At} K_{jt}^\alpha L_{jt}^{1-\alpha} \implies Y_j = Z_A K_j^\alpha L_j^{1-\alpha} \quad (\text{B.49})$$

11. Optimal Price:

$$P_t^* = \frac{\psi}{\psi - 1} \cdot \frac{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{j,t+s} \Lambda_{t+s} / \prod_{k=0}^{s-1} (1 + R_{t+k}) \right\}}{\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \theta^s Y_{j,t+s} / \prod_{k=0}^{s-1} (1 + R_{t+k}) \right\}} \implies \quad (\text{B.32})$$

$$P^* = \frac{\psi}{\psi - 1} \cdot \frac{Y_j \Lambda / [1 - \theta(1 - R)]}{Y_j / [1 - \theta(1 - R)]} \implies$$

$$P^* = \frac{\psi}{\psi - 1} \Lambda \quad (\text{B.50})$$

12. Market Clearing Condition:

$$Y_t = C_t + I_t \implies Y = C + I \quad (\text{B.51})$$

13. Monetary Policy:

$$\frac{R_t}{R} = \left( \frac{R_{t-1}}{R} \right)^{\gamma_R} \left[ \left( \frac{\pi_t}{\pi} \right)^{\gamma_\pi} \left( \frac{Y_t}{Y} \right)^{\gamma_Y} \right]^{1-\gamma_R} Z_{Mt} \implies Z_M = 1 \quad (\text{B.52})$$

14. Gross Inflation Rate:

$$\pi_t = \frac{P_t}{P_{t-1}} \implies \pi = 1 \quad (\text{B.53})$$

15. Productivity Shock:

$$\begin{aligned} \ln Z_{At} &= (1 - \rho_A) \ln Z_A + \rho_A \ln Z_{A,t-1} + \varepsilon_{At} \implies \\ \ln Z_A &= (1 - \rho_A) \ln Z_A + \rho_A \ln Z_A + \varepsilon_A \implies \\ \varepsilon_A &= 0 \end{aligned} \quad (\text{B.54})$$

16. Monetary Shock:

$$\begin{aligned} \ln Z_{Mt} &= (1 - \rho_M) \ln Z_M + \rho_M \ln Z_{M,t-1} + \varepsilon_{Mt} \implies \\ \ln Z_M &= (1 - \rho_M) \ln Z_M + \rho_M \ln Z_M + \varepsilon_M \implies \\ \varepsilon_M &= 0 \end{aligned} \quad (\text{B.55})$$

### B.5.1 Variables in Steady State

For the steady state solution, all endogenous variables will be determined with respect to the parameters. It's assumed that the productivity and the price level are normalized to one:  $[P \ Z_A] = \vec{1}$ <sup>14</sup>.

From B.45, the optimal price  $P^*$  is:

$$P^* = P \quad (\text{B.56})$$

From B.53, the gross inflation rate is:

$$\pi = 1 \quad (\text{B.57})$$

From B.52, the monetary shock is:

$$Z_M = 1 \quad (\text{B.58})$$

From B.54 and B.55, the productivity and monetary shocks are:

$$\varepsilon_A = \varepsilon_M = 0 \quad (\text{B.59})$$

From B.41, the return on capital  $R$  is:

$$1 = \beta \left[ (1 - \delta) + \frac{R}{P} \right] \implies R = P \left[ \frac{1}{\beta} - (1 - \delta) \right] \quad (\text{B.60})$$

From B.50 and B.45, the marginal cost  $\Lambda$  is:

$$P^* = \frac{\psi}{\psi - 1} \Lambda \implies \Lambda = P \frac{\psi - 1}{\psi} \quad (\text{B.61})$$

From equation B.48, the nominal wage  $W$  is:

$$\Lambda = \frac{1}{Z_A} \left( \frac{R}{\alpha} \right)^\alpha \left( \frac{W}{1 - \alpha} \right)^{1 - \alpha} \implies W = (1 - \alpha) \left[ \Lambda Z_A \left( \frac{\alpha}{R} \right)^\alpha \right]^{\frac{1}{1 - \alpha}} \quad (\text{B.62})$$

<sup>14</sup> where  $\vec{1}$  is the unit vector.

In steady state, prices are the same ( $P = P^*$ ), resulting in a gross inflation level of one ( $\pi = 1$ ), and all firms producing the same output level ( $Y_j = Y$ ) due to the price parity (SOLIS-GARCIA, 2022, Lecture 13, p.12). For this reason, they all demand the same amount of factors ( $K, L$ ), and equations B.46, B.47, and B.49 become:

$$K = \alpha Y \frac{\Lambda}{R} \quad (\text{B.63})$$

$$L = (1 - \alpha) Y \frac{\Lambda}{W} \quad (\text{B.64})$$

$$Y = Z_A K^\alpha L^{1-\alpha} \quad (\text{B.65})$$

Substitute B.63 in B.43:

$$I = \delta K \implies I = \delta \alpha Y \frac{\Lambda}{R} \quad (\text{B.66})$$

Substitute B.64 in B.40:

$$\frac{\phi L^\varphi}{C^{-\sigma}} = \frac{W}{P} \implies C = \left[ L^{-\varphi} \frac{W}{\phi P} \right]^{\frac{1}{\sigma}} \implies C = \left[ \left( (1 - \alpha) Y \frac{\Lambda}{W} \right)^{-\varphi} \frac{W}{\phi P} \right]^{\frac{1}{\sigma}} \quad (\text{B.67})$$

Substitute B.66 and B.67 in B.51:

$$\begin{aligned} Y &= C + I && \implies \\ Y &= \left[ \left( (1 - \alpha) Y \frac{\Lambda}{W} \right)^{-\varphi} \frac{W}{\phi P} \right]^{\frac{1}{\sigma}} + \left[ \delta \alpha Y \frac{\Lambda}{R} \right] && \implies \\ Y &= \left[ \left( \frac{W}{\phi P} \right) \left( \frac{W}{(1 - \alpha) \Lambda} \right)^\varphi \left( \frac{R}{R - \delta \alpha \Lambda} \right)^\sigma \right]^{\frac{1}{\varphi + \sigma}} \end{aligned} \quad (\text{B.68})$$

For  $C, K, L, I$ , use the result from B.68 in B.67, B.63, B.64 and B.43, respectively.

### B.5.2 Steady State Solution

$$\begin{bmatrix} P & P^* & \pi & Z_A & Z_M \end{bmatrix} = \vec{1} \quad (\text{B.69})$$

$$\begin{bmatrix} \varepsilon_A & \varepsilon_M \end{bmatrix} = \vec{0} \quad (\text{B.70})$$

$$R = P \left[ \frac{1}{\beta} - (1 - \delta) \right] \quad (\text{B.60})$$

$$\Lambda = P \frac{\psi - 1}{\psi} \quad (\text{B.61})$$

$$W = (1 - \alpha) \left[ \Lambda Z_A \left( \frac{\alpha}{R} \right)^\alpha \right]^{\frac{1}{1-\alpha}} \quad (\text{B.62})$$

$$Y = \left[ \left( \frac{W}{\phi P} \right) \left( \frac{W}{(1 - \alpha)\Lambda} \right)^\varphi \left( \frac{R}{R - \delta\alpha\Lambda} \right)^\sigma \right]^{\frac{1}{\varphi + \sigma}} \quad (\text{B.68})$$

$$C = \left[ \left( (1 - \alpha)Y \frac{\Lambda}{W} \right)^{-\varphi} \frac{W}{\phi P} \right]^{\frac{1}{\sigma}} \quad (\text{B.67})$$

$$K = \alpha Y \frac{\Lambda}{R} \quad (\text{B.63})$$

$$L = (1 - \alpha)Y \frac{\Lambda}{W} \quad (\text{B.64})$$

$$I = \delta K \quad (\text{B.43})$$

## B.6 Log-linearization

Due to the number of variables and equations to be solved, computational brute force will be necessary. Dynare is a software specialized on macroeconomic modeling, used for solving DSGE models. Before the model can be processed by the software, it must be linearized in order to eliminate the infinite sum in equation B.32. For this purpose, Uhlig's rules of log-linearization (UHLIG, 1999) will be applied to all equations in the model<sup>15</sup>.

---

<sup>15</sup> see lemma A.3 for details.

## Gross Inflation Rate

Log-linearize B.35 and define the level deviation of gross inflation rate  $\tilde{\pi}_t$ :

$$\pi_t = \frac{P_t}{P_{t-1}} \implies \quad (\text{B.35})$$

$$\tilde{\pi}_t = \hat{P}_t - \hat{P}_{t-1} \quad (\text{B.71})$$

## New Keynesian Phillips Curve

In order to log-linearize equation B.32, it is necessary to eliminate both the summation and the product operators. To handle the product operator, apply lemma A.5:

$$\begin{aligned} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s P_t^* Y_{j,t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} &= \frac{\psi}{\psi - 1} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s Y_{j,t+s} \Lambda_{t+s}}{\prod_{k=0}^{s-1} (1 + R_{t+k})} \right\} \implies \quad (\text{B.32}) \\ \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s P_t^* Y_{j,t+s}}{(1+R)^s \left(1 + \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k}\right)} \right\} &= \\ &= \frac{\psi}{\psi - 1} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s Y_{j,t+s} \Lambda_{t+s}}{(1+R)^s \left(1 + \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k}\right)} \right\} \end{aligned} \quad (\text{B.72})$$

First, log-linearize the left hand side of equation B.72 with respect to  $P_t^*$ ,  $Y_{j,t}$ ,  $\tilde{R}_t$ :

$$\begin{aligned} \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s P_t^* Y_{j,t+s}}{(1+R)^s \left(1 + \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k}\right)} \right\} &\implies \\ \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left(\frac{\theta}{1+R}\right)^s \frac{P_t^* Y_j (1 + \hat{P}_t^* + \hat{Y}_{j,t+s})}{1 + \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k}} \right\} &\implies \\ P_t^* Y_j \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left(\frac{\theta}{1+R}\right)^s \left(1 + \hat{P}_t^* + \hat{Y}_{j,t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k}\right) \right\} \end{aligned}$$

Separate the terms not dependent on  $s$ :

$$P^*Y_j(1 + \hat{P}_t^*)\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \right\} + \\ + P^*Y_j\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \left( \hat{Y}_{j,t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\} \implies$$

Apply definition A.9 on the first term:

$$\frac{P^*Y_j(1 + \hat{P}_t^*)}{1 - \theta/(1+R)} + P^*Y_j\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \left( \hat{Y}_{j,t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\}$$

Second, log-linearize the left hand side of equation B.72 with respect to  $\Lambda_t^*, Y_{j,t}, \tilde{R}_t$ :

$$\frac{\psi}{\psi-1}\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \frac{\theta^s Y_{j,t+s} \Lambda_{t+s}}{(1+R)^s \left( 1 + \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right)} \right\} \implies \\ \frac{\psi}{\psi-1}\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \frac{Y_j \Lambda (1 + \hat{Y}_{j,t+s} + \hat{\Lambda}_{t+s})}{1 + \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k}} \right\} \implies \\ \frac{\psi}{\psi-1} Y_j \Lambda \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \left( 1 + \hat{Y}_{j,t+s} + \hat{\Lambda}_{t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\}$$

Separate the terms not dependent on  $s$ :

$$\frac{\psi}{\psi-1} Y_j \Lambda \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \right\} + \\ + \frac{\psi}{\psi-1} Y_j \Lambda \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \left( \hat{Y}_{j,t+s} + \hat{\Lambda}_{t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\}$$

Apply definition A.9 on the first term:

$$\frac{\psi}{\psi-1} \cdot \frac{Y_j \Lambda}{1 - \theta/(1+R)} + \\ + \frac{\psi}{\psi-1} Y_j \Lambda \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \left( \hat{Y}_{j,t+s} + \hat{\Lambda}_{t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\}$$

Join both sides of the equation again:

$$\begin{aligned}
& \frac{P^*Y_j(1 + \hat{P}_t^*)}{1 - \theta/(1 + R)} + P^*Y_j\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \left( \hat{Y}_{j,t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\} = \\
& = \frac{\psi}{\psi-1} \cdot \frac{Y_j\Lambda}{1 - \theta/(1 + R)} + \\
& + \frac{\psi}{\psi-1} Y_j\Lambda \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ \left( \frac{\theta}{1+R} \right)^s \left( \hat{Y}_{j,t+s} + \hat{\Lambda}_{t+s} - \frac{1}{1+R} \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\} \quad (\text{B.73})
\end{aligned}$$

Define a nominal discount rate  $\varrho$  in steady state:

$$1 = \varrho(1 + R) \implies \varrho = \frac{1}{1+R} \quad (\text{B.74})$$

Substitute B.74 in B.73:

$$\begin{aligned}
& \frac{P^*Y_j(1 + \hat{P}_t^*)}{1 - \theta\varrho} + P^*Y_j\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ (\theta\varrho)^s \left( \hat{Y}_{j,t+s} - \varrho \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\} = \frac{\psi}{\psi-1} \cdot \frac{Y_j\Lambda}{1 - \theta\varrho} + \\
& + \frac{\psi}{\psi-1} Y_j\Lambda \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ (\theta\varrho)^s \left( \hat{Y}_{j,t+s} + \hat{\Lambda}_{t+s} - \varrho \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\} \quad (\text{B.75})
\end{aligned}$$

Substitute B.61 in B.75 and simplify all common terms:

$$\begin{aligned}
& \cancel{\frac{P^*Y_j}{1 - \theta\varrho}} + \cancel{\frac{P^*Y_j\hat{P}_t^*}{1 - \theta\varrho}} + \cancel{P^*Y_j\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ (\theta\varrho)^s \left( \hat{Y}_{j,t+s} - \varrho \sum_{k=0}^{s-1} \tilde{R}_{t+k} \right) \right\}} = \\
& = \cancel{\frac{P^*Y_j}{1 - \theta\varrho}} + \cancel{P^*Y_j\mathbb{E}_t \sum_{s=0}^{\infty} \left\{ (\theta\varrho)^s \left( \hat{Y}_{j,t+s} - \varrho \sum_{k=0}^{s-1} \tilde{R}_{t+k} + \hat{\Lambda}_{t+s} \right) \right\}} \implies \\
& \frac{\hat{P}_t^*}{1 - \theta\varrho} = \mathbb{E}_t \sum_{s=0}^{\infty} \left\{ (\theta\varrho)^s (\hat{\Lambda}_{t+s}) \right\} \quad (\text{B.76})
\end{aligned}$$

Define the real marginal cost  $\lambda_t$ :

$$\begin{aligned}
\lambda_t &= \frac{\Lambda_t}{P_t} \implies \Lambda_t = P_t\lambda_t \implies \\
\hat{\Lambda}_t &= \hat{P}_t + \lambda_t \quad (\text{B.77})
\end{aligned}$$

Substitute B.77 in B.76:

$$\hat{P}_t^* = (1 - \theta\varrho)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\varrho)^s (\hat{P}_{t+s} + \hat{\lambda}_{t+s}) \quad (\text{B.78})$$

Log-linearize equation B.33:

$$\begin{aligned} P_t^{1-\psi} &= \theta P_{t-1}^{1-\psi} + (1 - \theta) P_t^{*1-\psi} \implies (\text{B.33}) \\ P^{1-\psi}(1 + (1 - \psi)\hat{P}_t) &= \theta P^{1-\psi}(1 + (1 - \psi)\hat{P}_{t-1}) + \\ &\quad + (1 - \theta)P^{1-\psi}(1 + (1 - \psi)\hat{P}_t^*) \implies \\ \hat{P}_t &= \theta\hat{P}_{t-1} + (1 - \theta)\hat{P}_t^* \end{aligned} \quad (\text{B.79})$$

Substitute B.78 in B.79:

$$\hat{P}_t = \theta\hat{P}_{t-1} + (1 - \theta)\hat{P}_t^* \quad (\text{B.79})$$

$$\hat{P}_t = \theta\hat{P}_{t-1} + (1 - \theta)(1 - \theta\varrho)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\varrho)^s (\hat{P}_{t+s} + \hat{\lambda}_{t+s}) \quad (\text{B.80})$$

Finally, to eliminate the summation, apply the lead operator  $(1 - \theta\varrho\mathbb{L}^{-1})^{16}$  in B.80:

$$\begin{aligned} (1 - \theta\varrho\mathbb{L}^{-1})\hat{P}_t &= (1 - \theta\varrho\mathbb{L}^{-1}) \left[ \theta\hat{P}_{t-1} + \right. \\ &\quad \left. + (1 - \theta)(1 - \theta\varrho)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\varrho)^s (\hat{P}_{t+s} + \hat{\lambda}_{t+s}) \right] \implies \\ \hat{P}_t - \theta\varrho\mathbb{E}_t\hat{P}_{t+1} &= \theta\hat{P}_{t-1} - \theta\varrho\theta\hat{P}_t + \\ &\quad (1 - \theta)(1 - \theta\varrho)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\varrho)^s (\hat{P}_{t+s} + \hat{\lambda}_{t+s}) - \\ &\quad - \theta\varrho(1 - \theta)(1 - \theta\varrho)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\varrho)^s (\hat{P}_{t+s+1} + \hat{\lambda}_{t+s+1}) \end{aligned} \quad (\text{B.81})$$

In the first summation, factor out the first term and in the second summation, include the term  $\theta\varrho$  within the operator. Then, cancel the summations and rearrange

<sup>16</sup> see definition A.10.

the terms:

$$\begin{aligned}
\hat{P}_t - \theta\varrho\mathbb{E}_t\hat{P}_{t+1} &= \theta\hat{P}_{t-1} - \theta\varrho\theta\hat{P}_t + \\
&\quad (1-\theta)(1-\theta\varrho)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\varrho)^s (\hat{P}_{t+s} + \hat{\lambda}_{t+s}) - \\
&\quad - \theta\varrho(1-\theta)(1-\theta\varrho)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\varrho)^s (\hat{P}_{t+s+1} + \hat{\lambda}_{t+s+1}) \implies \\
\hat{P}_t - \theta\varrho\mathbb{E}_t\hat{P}_{t+1} &= \theta\hat{P}_{t-1} - \theta\varrho\theta\hat{P}_t + (1-\theta)(1-\theta\varrho)(\hat{P}_t + \hat{\lambda}_t) + \\
&\quad + (1-\theta)(1-\theta\varrho)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\varrho)^{s+1} (\hat{P}_{t+s+1} + \hat{\lambda}_{t+s+1}) - \\
&\quad - (1-\theta)(1-\theta\varrho)\mathbb{E}_t \sum_{s=0}^{\infty} (\theta\varrho)^{s+1} (\hat{P}_{t+s+1} + \hat{\lambda}_{t+s+1}) \implies \\
\hat{P}_t - \theta\varrho\mathbb{E}_t\hat{P}_{t+1} &= \theta\hat{P}_{t-1} - \theta^2\varrho\hat{P}_t + (1-\theta-\theta\varrho+\theta^2\varrho)\hat{P}_t + (1-\theta)(1-\theta\varrho)\hat{\lambda}_t \implies \\
(\hat{P}_t - \hat{P}_{t-1}) &= \varrho(\mathbb{E}_t\hat{P}_{t+1} - \hat{P}_t) + \frac{(1-\theta)(1-\theta\varrho)}{\theta}\hat{\lambda}_t
\end{aligned} \tag{B.82}$$

Substitute B.71 in B.82:

$$\tilde{\pi}_t = \varrho\mathbb{E}_t\tilde{\pi}_{t+1} + \frac{(1-\theta)(1-\theta\varrho)}{\theta}\hat{\lambda}_t \tag{B.83}$$

Equation B.83 is the New Keynesian Phillips Curve in terms of the real marginal cost. It illustrates that the deviation of inflation depends on both the expectation of future inflation deviation and the present marginal cost deviation.

## Labor Supply

Log-linearize B.9:

$$\frac{\phi L_t^\varphi}{C_t^{-\sigma}} = \frac{W_t}{P_t} \implies \tag{B.9}$$

$$\varphi\hat{L}_t + \sigma\hat{C}_t = \hat{W}_t - \hat{P}_t \tag{B.84}$$

## Household Euler Equation

Log-linearize B.10:

$$\left( \frac{\mathbb{E}_t C_{t+1}}{C_t} \right)^\sigma = \beta \left[ (1 - \delta) + \mathbb{E}_t \left( \frac{R_{t+1}}{P_{t+1}} \right) \right] \implies \quad (\text{B.10})$$

$$\mathbb{E}_t \hat{C}_{t+1} - \hat{C}_t = \frac{\beta R}{\sigma P} \mathbb{E}_t (\hat{R}_{t+1} - \hat{P}_{t+1}) \quad (\text{B.85})$$

## Law of Motion for Capital

Log-linearize B.3:

$$K_{t+1} = (1 - \delta)K_t + I_t \implies \quad (\text{B.3})$$

$$\hat{K}_{t+1} = (1 - \delta)\hat{K}_t + \delta\hat{I}_t \quad (\text{B.86})$$

## Bundle Technology

Apply the natural logarithm to B.12:

$$\ln Y_t = \frac{\psi}{\psi - 1} \ln \left( \int_0^1 Y_{jt}^{\frac{\psi-1}{\psi}} \, dj \right)$$

Log-linearize using corollary A.3.1:

$$\ln Y + \hat{Y}_t = \frac{\psi}{\psi - 1} \left[ \ln \left( \int_0^1 Y_j^{\frac{\psi-1}{\psi}} \, dj \right) + \frac{\psi - 1}{\psi} \int_0^1 \hat{Y}_{jt} \, dj \right] \implies$$

$$\ln Y + \hat{Y}_t = \frac{\psi}{\psi - 1} \left[ \ln \left( Y_j^{\frac{\psi-1}{\psi}} \int_0^1 \, dj \right) + \frac{\psi - 1}{\psi} \int_0^1 \hat{Y}_{jt} \, dj \right] \implies$$

$$\ln Y + \hat{Y}_t = \cancel{\frac{\psi}{\psi - 1}} \left[ \cancel{\frac{\psi - 1}{\psi}} \ln Y_j + \ln \cancel{1} + \cancel{\frac{\psi - 1}{\psi}} \int_0^1 \hat{Y}_{jt} \, dj \right] \implies$$

$$\ln Y + \hat{Y}_t = \ln Y_j + \int_0^1 \hat{Y}_{jt} \, dj$$

Apply corollary A.2.1:

$$\begin{aligned} \ln Y + \hat{Y}_t &= \ln Y_j + \int_0^1 \hat{Y}_{jt} \, dj \implies \\ \hat{Y}_t &= \int_0^1 \hat{Y}_{jt} \, dj \end{aligned} \tag{B.87}$$

### Marginal Cost

Log-linearize B.26:

$$\begin{aligned} \Lambda_t &= Z_{At}^{-1} \frac{R_t^\alpha W_t^{1-\alpha}}{\alpha^\alpha (1-\alpha)^{1-\alpha}} \implies \\ \Lambda(1 + \hat{\Lambda}_t) &= \frac{1}{Z_A} \left( \frac{R}{\alpha} \right)^\alpha \left( \frac{W}{1-\alpha} \right)^{1-\alpha} (1 - \hat{Z}_{At} + \alpha \hat{R}_t + (1-\alpha) \hat{W}_t) \implies \\ \hat{\Lambda}_t &= \alpha \hat{R}_t + (1-\alpha) \hat{W}_t - \hat{Z}_{At} \end{aligned} \tag{B.88}$$

Substitute B.77 in B.88:

$$\begin{aligned} \hat{\Lambda}_t &= \alpha \hat{R}_t + (1-\alpha) \hat{W}_t - \hat{Z}_{At} \implies \\ \hat{P}_t + \hat{\lambda}_t &= \alpha \hat{R}_t + (1-\alpha) \hat{W}_t - \hat{Z}_{At} \implies \\ \hat{\lambda}_t &= \alpha \hat{R}_t + (1-\alpha) \hat{W}_t - \hat{Z}_{At} - \hat{P}_t \end{aligned} \tag{B.89}$$

### Production Function

Log-linearize B.17:

$$\begin{aligned} Y_{jt} &= Z_{At} K_{jt}^\alpha L_{jt}^{1-\alpha} \implies \\ Y_j(1 + \hat{Y}_{jt}) &= Z_A K_j^\alpha L_j^{1-\alpha} (1 + \hat{Z}_{At} + \alpha \hat{K}_{jt} + (1-\alpha) \hat{L}_{jt}) \implies \\ \hat{Y}_{jt} &= \hat{Z}_{At} + \alpha \hat{K}_{jt} + (1-\alpha) \hat{L}_{jt} \end{aligned} \tag{B.90}$$

Substitute B.90 in B.87:

$$\hat{Y}_t = \int_0^1 \hat{Y}_{jt} \, dj \implies \quad (\text{B.87})$$

$$\hat{Y}_t = \int_0^1 [\hat{Z}_{At} + \alpha \hat{K}_{jt} + (1 - \alpha) \hat{L}_{jt}] \, dj \implies$$

$$\hat{Y}_t = \hat{Z}_{At} + \alpha \int_0^1 \hat{K}_{jt} \, dj + (1 - \alpha) \int_0^1 \hat{L}_{jt} \, dj \quad (\text{B.91})$$

Apply the natural logarithm and then log-linearize B.39:

$$\begin{aligned} L_t &= \int_0^1 L_{jt} \, dj \implies \\ \ln L_t &= \ln \left[ \int_0^1 L_{jt} \, dj \right] \implies \\ \ln L + \hat{L}_t &= \ln \left[ \int_0^1 L_{jt} \, dj \right] + \int_0^1 \hat{L}_{jt} \, dj \implies \\ \ln L + \hat{L}_t &= \ln L_j + \ln 1 + \int_0^1 \hat{L}_{jt} \, dj \end{aligned} \quad (\text{B.39})$$

Apply corollary A.2.1:

$$\implies \hat{L}_t = \int_0^1 \hat{L}_{jt} \, dj \quad (\text{B.92})$$

By analogy, the total capital deviation is the sum of all firm's deviations:

$$\hat{K}_t = \int_0^1 \hat{K}_{jt} \, dj \quad (\text{B.93})$$

Substitute B.92 and B.93 in B.91:

$$\hat{Y}_t = \hat{Z}_{At} + \alpha \int_0^1 \hat{K}_{jt} \, dj + (1 - \alpha) \int_0^1 \hat{L}_{jt} \, dj \implies \quad (\text{B.91})$$

$$\hat{Y}_t = \hat{Z}_{At} + \alpha \hat{K}_t + (1 - \alpha) \hat{L}_t \quad (\text{B.94})$$

## Capital Demand

Log-linearize B.19:

$$\begin{aligned} K_{jt} &= \alpha Y_{jt} \frac{\Lambda_t}{R_t} \implies \\ K_j(1 + \hat{K}_{jt}) &= \alpha Y_j \frac{\Lambda}{R} (1 + \hat{Y}_{jt} + \hat{\Lambda}_t - \hat{R}_t) \implies \\ \hat{K}_{jt} &= \hat{Y}_{jt} + \hat{\Lambda}_t - \hat{R}_t \end{aligned} \tag{B.19}$$

Integrate both sides and then substitute B.93 and B.87:

$$\begin{aligned} \int_0^1 \hat{K}_{jt} \, dj &= \int_0^1 (\hat{Y}_{jt} + \hat{\Lambda}_t - \hat{R}_t) \, dj \implies \\ \hat{K}_t &= \hat{Y}_t + \hat{\Lambda}_t - \hat{R}_t \end{aligned} \tag{B.95}$$

## Labor Demand

Log-linearize B.20:

$$\begin{aligned} L_{jt} &= (1 - \alpha) Y_{jt} \frac{\Lambda_t}{W_t} \implies \\ L_j(1 + \hat{L}_{jt}) &= (1 - \alpha) Y_j \frac{\Lambda}{W} (1 + \hat{Y}_{jt} + \hat{\Lambda}_t - \hat{W}_t) \implies \\ \hat{L}_{jt} &= \hat{Y}_{jt} + \hat{\Lambda}_t - \hat{W}_t \end{aligned} \tag{B.20}$$

Integrate both sides and then substitute B.92 and B.87:

$$\begin{aligned} \int_0^1 \hat{L}_{jt} \, dj &= \int_0^1 \hat{Y}_{jt} + \hat{\Lambda}_t - \hat{W}_t \, dj \implies \\ \hat{L}_t &= \hat{Y}_t + \hat{\Lambda}_t - \hat{W}_t \end{aligned} \tag{B.96}$$

Subtract B.96 from B.95:

$$\begin{aligned} \hat{K}_t - \hat{L}_t &= \hat{Y}_t + \hat{\Lambda}_t - \hat{R}_t - (\hat{Y}_t + \hat{\Lambda}_t - \hat{W}_t) \implies \\ \hat{K}_t - \hat{L}_t &= \hat{W}_t - \hat{R}_t \end{aligned} \tag{B.97}$$

Equation B.97 is the log-linearized version of B.21.

## Market Clearing Condition

Log-linearize B.38:

$$\begin{aligned}
 Y_t &= C_t + I_t &\implies && (\text{B.38}) \\
 Y(1 + \hat{Y}_t) &= C(1 + \hat{C}_t) + I(1 + \hat{I}_t) &\implies && \\
 Y + Y\hat{Y}_t &= C + C\hat{C}_t + I + I\hat{I}_t &\implies && \\
 Y\hat{Y}_t &= C\hat{C}_t + I\hat{I}_t &\implies && \\
 \hat{Y}_t &= \frac{C}{Y}\hat{C}_t + \frac{I}{Y}\hat{I}_t &&& (\text{B.98})
 \end{aligned}$$

Define the consumption and investment weights  $[\theta_C \ \theta_I]$  in the production total:

$$[\theta_C \ \theta_I] := \left[ \frac{C}{Y} \ \frac{I}{Y} \right] \quad (\text{B.99})$$

Substitute B.99 in B.98:

$$\begin{aligned}
 \hat{Y}_t &= \frac{C}{Y}\hat{C}_t + \frac{I}{Y}\hat{I}_t \implies \\
 \hat{Y}_t &= \theta_C\hat{C}_t + \theta_I\hat{I}_t
 \end{aligned} \quad (\text{B.100})$$

## Monetary Policy

Log-linearize B.34:

$$\begin{aligned}
 \frac{R_t}{R} &= \frac{R_{t-1}^{\gamma_R}(\pi_t^{\gamma_\pi} Y_t^{\gamma_Y})^{(1-\gamma_R)} Z_{Mt}}{R^{\gamma_R}(\pi^{\gamma_\pi} Y^{\gamma_Y})^{(1-\gamma_R)}} \implies && (\text{B.34}) \\
 \frac{R(1 + \hat{R}_t)}{R} &= \\
 &= \frac{R^{\gamma_R}(\pi^{\gamma_\pi} Y^{\gamma_Y})^{(1-\gamma_R)} Z_M [1 + \gamma_R \hat{R}_{t-1} + (1 - \gamma_R)(\gamma_\pi \tilde{\pi}_t + \gamma_Y \hat{Y}_t) + \hat{Z}_{Mt}]}{R^{\gamma_R}(\pi^{\gamma_\pi} Y^{\gamma_Y})^{(1-\gamma_R)}} \implies \\
 \hat{R}_t &= \gamma_R \hat{R}_{t-1} + (1 - \gamma_R)(\gamma_\pi \tilde{\pi}_t + \gamma_Y \hat{Y}_t) + \hat{Z}_{Mt}
 \end{aligned} \quad (\text{B.101})$$

## Productivity Shock

Log-linearize B.36:

$$\begin{aligned}\ln Z_{At} &= (1 - \rho_A) \ln Z_A + \rho_A \ln Z_{A,t-1} + \varepsilon_{At} \implies \text{(B.36)} \\ \ln Z_A + \hat{Z}_{At} &= (1 - \rho_A) \ln Z_A + \rho_A (\ln Z_A + \hat{Z}_{A,t-1}) + \varepsilon_A \implies \\ \hat{Z}_{At} &= \rho_A \hat{Z}_{A,t-1} + \varepsilon_A\end{aligned}\quad \text{(B.102)}$$

## Monetary Shock

Log-linearize B.37:

$$\begin{aligned}\ln Z_{Mt} &= (1 - \rho_M) \ln Z_M + \rho_M \ln Z_{M,t-1} + \varepsilon_{Mt} \implies \text{(B.37)} \\ \ln Z_M + \hat{Z}_{Mt} &= (1 - \rho_M) \ln Z_M + \rho_M (\ln Z_M + \hat{Z}_{M,t-1}) + \varepsilon_M \implies \\ \hat{Z}_{Mt} &= \rho_M \hat{Z}_{M,t-1} + \varepsilon_M\end{aligned}\quad \text{(B.103)}$$

### B.6.1 Log-linear Model Structure

The log-linear model is a square system of 12 variables and 12 equations, summarized as follows:

- Variables:  $(\tilde{\pi} \quad \hat{P} \quad \hat{\lambda} \quad \hat{C} \quad \hat{L} \quad \hat{R} \quad \hat{K} \quad \hat{I} \quad \hat{W} \quad \hat{Z}_A \quad \hat{Y} \quad \hat{Z}_M)$
- Equations:

1. Gross Inflation Rate:

$$\tilde{\pi}_t = \hat{P}_t - \hat{P}_{t-1} \quad \text{(B.71)}$$

2. New Keynesian Phillips Curve:

$$\tilde{\pi}_t = \varrho \mathbb{E}_t \tilde{\pi}_{t+1} + \frac{(1 - \theta)(1 - \theta\varrho)}{\theta} \hat{\lambda}_t \quad \text{(B.83)}$$

3. Labor Supply:

$$\varphi \hat{L}_t + \sigma \hat{C}_t = \hat{W}_t - \hat{P}_t \quad \text{(B.84)}$$

4. Household Euler Equation:

$$\mathbb{E}_t \hat{C}_{t+1} - \hat{C}_t = \frac{\beta R}{\sigma P} \mathbb{E}_t (\hat{R}_{t+1} - \hat{P}_{t+1}) \quad \text{(B.85)}$$

5. Law of Motion for Capital:

$$\hat{K}_{t+1} = (1 - \delta)\hat{K}_t + \delta\hat{I}_t \quad (\text{B.86})$$

6. Real Marginal Cost:

$$\hat{\lambda}_t = \alpha\hat{R}_t + (1 - \alpha)\hat{W}_t - \hat{Z}_{At} - \hat{P}_t \quad (\text{B.89})$$

7. Production Function:

$$\hat{Y}_t = \hat{Z}_{At} + \alpha\hat{K}_t + (1 - \alpha)\hat{L}_t \quad (\text{B.94})$$

8. Marginal Rates of Substitution of Factors:

$$\hat{K}_t - \hat{L}_t = \hat{W}_t - \hat{R}_t \quad (\text{B.97})$$

9. Market Clearing Condition:

$$\hat{Y}_t = \theta_C\hat{C}_t + \theta_I\hat{I}_t \quad (\text{B.100})$$

10. Monetary Policy:

$$\hat{R}_t = \gamma_R\hat{R}_{t-1} + (1 - \gamma_R)(\gamma_\pi\tilde{\pi}_t + \gamma_Y\hat{Y}_t) + \hat{Z}_{Mt} \quad (\text{B.101})$$

11. Productivity Shock:

$$\hat{Z}_{At} = \rho_A\hat{Z}_{A,t-1} + \varepsilon_A \quad (\text{B.102})$$

12. Monetary Shock:

$$\hat{Z}_{Mt} = \rho_M\hat{Z}_{M,t-1} + \varepsilon_M \quad (\text{B.103})$$

## B.7 Parameter Calibration

refazer as tabelas de calibração do nk model...

Table 5: Parameter Calibration

Parameter	Definition	Calibration
$\alpha$	capital elasticity of production	0.35
$\beta$	intertemporal discount factor	0.985
$\gamma_R$	interest-rate smoothing parameter	0.79
$\gamma_\pi$	interest-rate sensitivity in relation to inflation	2.43
$\gamma_Y$	interest-rate sensitivity in relation to product	0.16
$\delta$	capital depreciation rate	0.025
$\theta$	price stickiness parameter	0.8
$\theta_{C11}$	weight of good 1 in demand of region 1	0.4
$\theta_{C12}$	weight of good 2 in demand of region 1	0.4
$\theta_{C21}$	weight of good 1 in demand of region 2	0.4
$\theta_{C22}$	weight of good 2 in demand of region 2	0.4
$\theta_{PY1}$	weight of region 1 in gross domestic product	0.3
$\theta_{Y1}$	weight of region 1 in total production	0.3
$\rho_{A1}$	autoregressive parameter of productivity in region 1	0.95
$\rho_{A2}$	autoregressive parameter of productivity in region 2	0.95
$\rho_M$	autoregressive parameter of monetary policy	0.9
$\sigma$	relative risk aversion coefficient	2
$\phi$	relative labor weight in utility	1
$\varphi$	marginal disutility of labor supply	1.5
$\psi$	elasticity of substitution between intermediate goods	8
$\omega_{11}$	weight of good 1 in consumption composition of region 1	0.5
$\omega_{21}$	weight of good 1 in consumption composition of region 2	0.5
